$DTT DEX

DDTOKEN
digital disintermediation

Bringing censorship resistance & privacy to the Ethereum Ecosystem and beyond

About me

Trenton won a prize in the 2020 Solana Hackathon and has focused on

ETHGlobal Hackathons in 2021, winning at least 13 prizes along with his team but in 2022 he would very much like to solve the privacy & censorship issuses in the Ethereum Ecosystem via our Ethereum-DERO bridge and $DTT DEX.

The Idea

How can you tell the truth is being told?

When Facebook blocks it.

Twitter deletes it.

Google hides it.

YouTube bans it.

Your Government forbids it

And media brands it as a Conspiracy Theory

Why do we need IPFS?

Dear trenton gaddis,

On **Friday, June 5, starting from 01:00AM SGT**, we will perform an infrastructure upgrade and migrate your account(s) from server sgp41.siteground.asia to a new server with the latest hardware in **our new Google facility in Singapore**. The accounts scheduled for transfer are:

ddtoken.io

This is a standard and seamless procedure that will be performed late at night when server traffic is minimal. We do not expect any downtime for your account, however brief outages of a few minutes are possible while migrating your data to the new server.

What you need to do?

Because your site will be migrated to a new machine in a different datacenter in the region, there will be an IP change and the DNS settings of your domain(s) have to be updated accordingly.

- If your domains are already pointed to SiteGround by nameservers, the DNS will be updated automatically without any action required on your end.
- If your domains are not pointed to SiteGround by namesevers, we kindly ask you to update their DNS manually. Once we perform the migration, we will send you an email with a list of all such domains on your account and the new DNS settings. You will have 14 days from that moment to update the settings, during which we will redirect automatically all the traffic from your old server to the new server, ensuring that there will be no downtime or loss of visitors.

We also kindly recommend that you avoid making any changes to your website on migration day in order to prevent data loss.

Please excuse us for any inconvenience caused by this procedure.

Unique property of IPFS

It is cool that IPFS nodes do not track geo-location in any way like Proof of Work, so I think it throws a monkey wrench in the way that the US GOV'T views DeFi front-ends, etc.

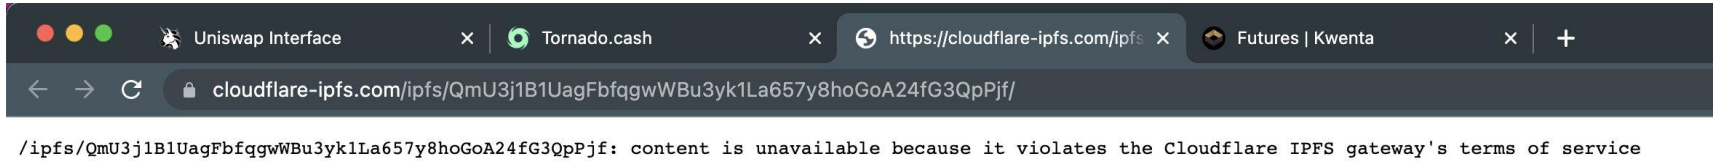

All that an IPFS node cares about is whether you have the corresponding encryption key (CID) to the content.

With a few friends pinning each other's websites on IPFS, you don't need to pay for web hosting anymore!

https://twitter.com/CryptoEscondido/status/1558625009396252672?s=20&t=tW7NEbJV3tPLetOjQTH0Kg

The problem

This just in – Cloudflare's IPFS gateway has fully censored the Tornado Cash app bundle.

This is why you need encryption on the base layer to enable censorship resistance and the homomorphic encryption of DERO solves this censorship conundrum.

https://twitter.com/liamzebedee/status/1577525264963100674?s=20&t=3oKSq40n1iLLSW6CYal2pg

Why running your own node is the solution

DuckDuckGo is owned by the same cult.

The coordination of censorship is fantastic & if something gets censored on Google, then it is also censored on DuckDuckGo, Startpage, Twitter, LinkedIn, etc.

I explained this in the Web3 Weekend & won a $350 prize.

If you run your own node, then you can enhance data permanency by ensuring you make the said content available, instead of relying on cult owned tech companies, etc.

Project Status

The Ethereum-DERO bridge is already on the Ethereum & DERO testnets but we will deploy to mainnet after an audit.

The $DTT DEX has a WEB3 front-end, DERODEX.nft, and we will deploy to mainnet after an audit.
